## *From the Prefaces to the Preceding Volumes*

New methods for the synthesis of organic compounds, improvements of known methods, and also old proved methods scattered in periodicals, are being recorded continuously in this book series.

An attempt has been made to develop the system of Weygand (*Organic Preparations*, Interscience Publishers, Inc., New York, 1945), and to group the reactions on a simple, although purely formal, basis. This has led to the invention of reaction symbols that can be classified systematically so that the methods can be treated without knowledge of the current trivial and author names (e.g., "Oxidation" and "Friedel-Crafts reaction").

Readers accustomed to the common notations will find these in the subject index. In many cases, particularly in searching for complex reactions, use of the classification system may be avoided by consulting the subject index. It is thought that the volumes should be kept close at hand. They should provide a quick survey, and obviate the immediate need for an elaborate library search. Syntheses are therefore recorded in the subject index by starting materials and end products, along with the systematic arrangement for the methods. This makes possible a sub-classification within the reaction symbols by reagents, a further methodical criterion. Starting with Volume 5, a table indicating the sequence of the reagents has been included. It may help the reader to locate reactions in the body of the text, particularly within large chapters. This table also contains such frequently used reagents as NaOH and HCl, which are not included in the subject index. Another innovation is the indexing of complex compounds with cross references under the related simpler compounds. General terms, such as synthesis, replacement, heterocyclics, may also be brought to the special attention of the reader.

The abstracts are limited to the information needed for an appraisal of the applicability of a desired synthesis. This includes the number and nature of the reaction steps, the yield, and the important literature in question. In order to carry out a particular synthesis it is therefore still necessary to have recourse to the original papers or, at least, to an abstract journal. In order to avoid repetition, selections are made on the basis of most detailed description and best yields, whenever the same method is used in similar cases. Continuations of papers already included will not be abstracted, unless they contain

essentially new information. They may, however, be quoted at the place corresponding to the abstracted papers. These supplementary references make it possible to keep abstracts of previous volumes up-to-date.

Furthermore, to avoid a "jungle" of references, the following limitations have been decided on: Papers are not included, if their content does not fit the subject matter of "Synthetic Methods" and if they can be found easily in the indexes of the abstract journals. Less accessible and readable papers, such as the Russian or Japanese ones, are only abstracted, as a rule, if the method in question is described nowhere else. Since publications dealing with organic chemistry are increasing from year to year, some unintentional omissions may occur as well. Therefore, the editor will be grateful if important methods not yet mentioned are brought to his attention.

Syntheses that are split into their various steps, which are recorded in different places, can be followed with the help of the notations *startg. m. f.* (starting material for the preparation of ...) and *prepn. s.* (preparation, see).

### *Aus den Vorworten zu den vorhergehenden Bänden*

In dieser Buchreihe sollen neue Methoden zur Synthese organischer Verbindungen, Verbesserungen bekannter und auch bewährte ältere Methoden, die sich in den in Fachzeitschriften veröffentlichten Originalarbeiten verstreut vorfinden, laufend registriert werden.

Aufbauend auf der Weygandschen Systematik wurde versucht, alle Reaktionen an Hand weniger einfacher, wenn auch rein formaler Richtlinien zu ordnen. Dies führte zur Ausarbeitung von Reaktions-Formelzeichen, die sich im Gegensatz zu den bisherigen Trivial- bzw. Autorennamen, wie Oxydation, Friedel-Crafts-Synthese, systematisch anordnen lassen. Man kann so die Methoden, ohne ihren Namen zu kennen, mittels des Formelzeichens auffinden.

Benutzer, die an die alten Bezeichnungen gewöhnt sind, finden diese im alphabetischen Register, das in vielen Fällen den Gebrauch der Systematik entbehrlich machen und besonders zum Aufsuchen komplizierter Reaktionen mit Vorteil benutzt werden dürfte. Da die Sammlung für die Handbibliothek am Arbeitsplatz im Laboratorium gedacht ist, soll sie eine rasche Orientierung gestatten, ohne daß fürs erste die Literatur der Instituts- oder Werkbibliothek herangezogen werden muß. Neben der systematischen Registrierung der Methoden werden deshalb im alphabetischen Register auch Synthesen durch ihre

Ausgangs- und Endprodukte registriert. Dies ermöglicht es, im Text, innerhalb der Reaktionszeichen, nach einem weiteren methodischen Kriterium, nämlich den Hilfsstoffen einzuteilen. Beginnend mit Band 5 ist eine Tafel aufgenommen worden, die die Reihenfolge der Hilfsstoffe angibt. Sie dürfte zum Aufsuchen von Reaktionen im Text, besonders in großen Kapiteln, nützlich sein. Sie enthält auch so häufig gebrauchte Hilfsstoffe wie NaOH und HCl, die im alphabetischen Register nicht aufgeführt sind. Neuartig ist ferner die Registrierung der komplizierten Verbindungen. Auf Sammelbegriffe wie Aufbau, Austausch, Heterocyclen sei noch besonders hingewiesen.

Die Referate beschränken sich auf das zur Beurteilung der Zweckmäßigkeit einer Synthese Notwendige, wie Zahl und Art der Reaktionsstufen, die Ausbeute, wichtige, die Methode betreffende Literatur usw. Vor Ausführung einer bestimmten Synthese ist es deshalb erforderlich, das chemische Zentralblatt oder ein anderes Referatenblatt und, wenn möglich, auch die Originalarbeit zu Rate zu ziehen. Zur Vermeidung von Wiederholungen wurden bei der Anwendung einer Methode in ähnlichen Fällen diejenigen ausgewählt, die am ausführlichsten beschrieben sind und die besten Ausbeuten geben. Fortsetzungen bereits aufgenommener Arbeiten, die nichts wesentlich Neues bringen, werden nicht mehr referiert, evtl. aber an der Stelle der aufgenommenen Arbeit zitiert. Diese Ergänzungszitate ermöglichen es, Referate aus früheren Bänden auf den neuesten Stand zu bringen.

Um ferner das Material nicht zu sehr auf Kosten der Uebersicht anschwellen zu lassen, werden Veröffentlichungen, die nicht ganz in den Rahmen der «Synth. Meth.» passen und die in den Sachregistern der Referatenblätter leicht aufgefunden werden können, nicht aufgenommen. Arbeiten aus schwerer zugänglichen und lesbaren Zeitschriften, wie z. B. den russischen und japanischen, werden im allgemeinen nur dann referiert, wenn die betreffende Methode sonst nirgends beschrieben ist. Da die Zahl der Veröffentlichungen auf dem Gebiete der organischen Chemie von Jahr zu Jahr zunimmt, unterbleibt die Aufnahme von Arbeiten manchmal auch unabsichtlich. Wir wären deshalb dankbar, wenn wir auf wichtige Methoden aufmerksam gemacht würden, die in unserer Sammlung noch nicht enthalten sind.

Synthesen, die in ihre Stufen zerlegt und an verschiedenen Stellen eingeordnet sind, können mit Hilfe der Vermerke *startg. m. f.* (Ausgangsmaterial für die Darstellung von ...) und *prepn. s.* (Darstellung siehe) zusammengesetzt werden.

## *Preface to Volume 9*

Most of the abstracts in this volume are of papers published between 1952 and 1954. As Volume 8 it contains a brief review, *Trends in Synthetic Organic Chemistry*, stressing some highlights of general interest and calling attention to developments too recent to be included in the body of the text.

The index covers only Volume 9, as the next volume, which concludes the second series, will contain both a cumulative index and arrangement of all titles of Volumes 6 to 10.

I want to thank Dr. John T. Plati once more for having checked the manuscript and Dr. Bernhard Prijs for his thorough proof-reading. I also greatly appreciate the valuable advice they have given me. Thanks are due again to Dr. J. A. Aeschlimann, Vice President of Hoffmann-La Roche, Inc., for liberally providing me with library and office facilities.

Nutley, New Jersey, U.S.A., May 1955.

W. Th.

## *Vorwort zu Band 9*

Der vorliegende Band 9 der «Synthetischen Methoden» bringt hauptsächlich Referate von Arbeiten aus dem Jahren 1952—1954. Auch dieser Band enthält einen kurzen Ueberblick, «*Trends in Synthetic Organic Chemistry*», der einige der wichtigsten Fortschritte allgemeinen Interesses aufzeigt und auf neue Arbeiten hinweist, die nicht mehr in den Hauptteil des Bandes aufgenommen werden konnten.

Das Register umfaßt diesmal nur einen Band, da der nächste Band, der die zweite Serie abschließt, sowohl ein Generalregister als auch alle Titel der Bände 6—10 enthalten wird.

Nutley, New Jersey, U.S.A., im Mai 1955.

W. Th.

## *Method of Classification*

The following directions serve to explain the system of Classification.

### 1. Reaction Symbols.

The first part of the symbol refers to the chemical bonds formed during the reaction. These bonds appear in the reaction symbols as the symbols for the two elements that have been linked together (e.g., the bond between hydrogen and nitrogen, as HN). The order of the elements is the same as in *Chemisches Zentralblatt* and in Beilstein's *Handbuch der organischen Chemie*: H, O, N, Hal (Halogen), S, and the remaining elements (Rem). C is always placed last.

The "principle of the latest position" determines the order of the element symbols, and is used whenever possible.

The methods of obtaining a particular chemical bond are subdivided according to methods of formation. Four types are distinguished: addition ( $\Downarrow$ ), rearrangement ( $\cap\downarrow$ ), exchange ( $\uparrow\downarrow$ ), and elimination ( $\uparrow\uparrow$ ). The last part of the symbol refers to the bonds which are destroyed in the reaction or to a characteristic element of that part of the molecule which is eliminated.

The following simplifying stipulations facilitate the use of the reaction symbols: (1) The chemical bond is rigidly classified according to the structure formula without taking the reaction mechanism into consideration. (2) Double or triple bonds are treated as being equivalent to two or three single bonds, respectively. (3) Generally speaking, only stable organic compounds are taken into consideration. Intermediary compounds, such as Grignard compounds and sodiomalonic esters, and anorganic reactants, such as nitric acid, are therefore not expressed in the reaction symbols.

### Examples:

see Volume II, page viii (Interscience Publishers)

### Systematic Survey

see page 473

## 2. Reagents.

A further subdivision, not included in the reaction symbols, is made on the basis of the reagents characteristic of the reaction. The order usually follows that of the periodic system. Reagents made up of several components are arranged according to the element significant for the reaction (e.g.,  $\text{KMnO}_4$  under Mn,  $\text{NaClO}$  under Cl). When a constituent of the reagent goes into the products of the reaction, the remainder of the reagent, which acts as a carrier of this constituent, is the criterion for the classification; for example, phosphorus is the carrier in a chlorination with  $\text{PCl}_5$  and sodium in a nitrosation with  $\text{NaNO}_2$ . A table indicating the sequence of the reagents may be found on page 477.

3. The material between the listings of the reagents is arranged with the simple examples first and the more complicated ones following.

4. When changes in more than one chemical bond occur during a reaction, as, for example, in the formation of a new ring, or if the reaction can be carried out in different ways, these reactions are introduced in several places when necessary. The main entry in such cases is placed usually according to the "principle of the latest position"; the other entries are cross-referenced back to it.

## Systematik

Für die Reihenfolge der Methoden gelten folgende Richtlinien:

### 1. Reaktionszeichen.

Die Einteilung erfolgt zuerst nach den Bindungen, die bei einer Reaktion entstehen. Diese erscheinen im Reaktions-Formelzeichen in Gestalt ihrer beiden Elementsymbole, z. B. die Bindung zwischen Wasserstoff und Stickstoff als HN. Die Reihenfolge der Elemente ist die gleiche wie im Chemischen Zentralblatt und in Beilsteins Handbuch der organischen Chemie: H, O, N, Hal (Halogen), S, Rem (Ueb-rige Elemente), C steht an letzter Stelle.

Das «*Prinzip der letzten Stelle*» bestimmt die Reihenfolge der Elementsymbole und ist auch sonst nach Möglichkeit immer angewandt worden.

Die Methoden zur Herstellung einer bestimmten Bindung werden nach ihrer Bildungsweise eingeteilt. Es werden 4 Fälle unterschieden: Aufnahme ( $\Downarrow$ ), Umlagerung ( $\curvearrowright$ ), Austausch ( $\leftrightarrow$ ) und Abgabe ( $\Uparrow$ ).

Der letzte Teil des Reaktionszeichens gibt die Bindung an, die gelöst wird, oder ein charakteristisches Element desjenigen Molekülteils, der abgespalten wird.

Die Bildung des Reaktionszeichens wird durch folgende vereinfachende Annahmen erleichtert:

1. Die Bindungen für die Registrierung ergeben sich rein formal aus den Strukturformeln, ohne daß auf Reaktionsmechanismen Rücksicht genommen wird.

2. Doppel- und Dreifachbindungen werden 2 bzw. 3 Einfachbindungen gleichgesetzt.

3. Es werden in der Regel nur stabile organische Verbindungen berücksichtigt, Zwischenprodukte, wie z. B. Grignard-Verbindungen, Na-Malonester und anorganische Reaktionspartner, wie z. B. Salpetersäure, werden deshalb nicht zur Bildung des Reaktionszeichens herangezogen.

## Beispiele

siehe Band 2, Seite VI.

## Systematische Uebersicht

siehe Seite 473.

## 2. Hilfsstoffe.

Eine weitere Unterteilung, die im Reaktionszeichen nicht mehr zum Ausdruck kommt, wird nach den für die Reaktion charakteristischen Hilfsstoffen vorgenommen. Ihre Reihenfolge richtet sich im wesentlichen nach dem periodischen System. Hilfsstoffe, die sich aus mehreren Bestandteilen zusammensetzen, werden nach demjenigen eingeteilt, der für die Reaktion verantwortlich ist, z. B. steht  $\text{KMnO}_4$  bei Mn,  $\text{NaClO}$  bei Cl. Geht ein Bestandteil des Hilfsstoffs in das Reaktionsprodukt ein, dann ist der Rest als Träger dieses Bestandteils für die Einordnung maßgebend; das ist z. B. bei einer Chlorierung mit  $\text{PCl}_5$  Phosphor, bei einer Nitrosierung mit  $\text{NaNO}_2$  Natrium. Eine Tafel der in diesem Band verwendeten Reihenfolge der Hilfsstoffe befindet sich auf Seite 477.

3. Innerhalb dieser Unterteilung sind die einzelnen Referate von einfachen zu komplizierten Beispielen fortschreitend angeordnet.

4. Treten bei einer Reaktion Veränderungen an mehreren Bindungen ein, wie z. B. bei Ringschlüssen, oder kann sie auf verschiedene Art durchgeführt werden, dann wird sie, falls notwendig an mehreren Stellen eingeordnet. Das Hauptzitat steht in diesen Fällen in der Regel an der letzten Stelle; an den übrigen Stellen befinden sich Hinweise auf dieses.

## *Trends*

### in Synthetic Organic Chemistry

1955

For a number of years, new catalytic high pressure and temperature syntheses have been developed by Reppe et al. (cf. *Synth. Meth.* 3, 588) who used acetylene and carbon monoxide as their principal starting materials. We do not intend to repeat the contents of several comprehensive publications on the subject<sup>1</sup>. More processes of this type, however, will eventually find their way into the current literature, and from there into future volumes of *Synthetic Methods*. In this connection, we mention the addition of HCN to unactivated carbon-carbon double bonds<sup>2</sup>, and the preparation of formamides with carbon monoxide<sup>3</sup>.

Whereas Reppe chemistry is essentially concerned with one-step syntheses of relatively simple compounds, which, in turn, can be used as building blocks for polymers, Woodward et al. have mastered multi-step syntheses of highly intricate compounds. To the synthesis of quinine, patuline, and the total synthesis of the steroid skeleton, they have recently added a 30-step synthesis of the strychnine molecule<sup>4</sup>, which has long engaged the efforts of many investigators. The total synthesis of lysergic acid in 14 steps has been carried out by a group of the Lilly Research Laboratories<sup>5</sup>. The synthesis of morphine by Gates and Tschudi<sup>6</sup> should also be mentioned at this point. The total steroid synthesis is attracting the attention of several industrial laboratories<sup>7</sup>. An improved oxidation method for obtaining the 17 $\alpha$ -hydroxy-20-keto group of the cortisone side chain<sup>8</sup> is a result of these experiments. A number of publications deals with ergosterol as a

starting material for a partial synthesis of hormones involving side chain degradation<sup>9</sup>.

The arsenal of peptide chemistry has been further enriched by a variety of new methods including the use of phosphorus compounds such as the so-called phosphazo compounds (9, 468), phosphite amides (9, 543), and pyrophosphites as intermediates. Pyrophosphites have been used in the total synthesis of polypeptides such as oxytocin (9, 464), the first natural polypeptide to be synthesized. Recently, activated esters have been introduced as promising acylating agents in peptide chemistry<sup>10</sup>. An interesting application of the Smith reaction in this field is the conversion of subst. acetoacetic esters to  $\alpha$ -amino esters<sup>11</sup>. N-Trifluoroacetyl derivatives may prove helpful in peptide chemistry because they are readily cleaved in alkaline media without damage being done to the peptide bond<sup>12</sup>. Carbodiimides can be employed in both the synthesis<sup>13</sup> and the degradation (9, 277) of peptides.

Protecting or blocking operations hitherto essentially confined to functional groups have been extended to the carbon skeleton itself by the use of *tert*-butyl as a blocking group. This group, of all alkyls, is exceptionally easy to remove from aromatic rings<sup>14</sup>. Preferential blocking of keto groups may be achieved by interchange with dioxolanes where direct ketalization is unsuccessful<sup>15</sup>. A mild two-step procedure for preparing phthalimides to protect sensitive *prim.* amines<sup>16</sup> and O-alkylation of phenolic N-bases without quaternization<sup>17</sup> have been described by Baker et al. In this connection, the temporary modification of a molecule as a means of boosting its reactivity may be mentioned such as the attachment of oxygen to amine-nitrogen to form the more reactive N-oxides<sup>18</sup>.

Transfer-hydrogenation<sup>19</sup> with palladium as catalyst and cyclohexene as hydrogen donor is often remarkably selective and may give

higher yields than direct catalytic hydrogenation or other methods of reduction. Phenolic hydroxyl groups may be removed by reducing the corresponding phosphoric esters with sodium or lithium in liquid ammonia<sup>20</sup>. Reductions with metal hydrides have been performed to advantage in pyridine, which has been used with  $\text{LiAlH}_4$  to obtain methylamines from formamides<sup>21</sup>, and with  $\text{NaBH}_4$  in the preferential reduction of steroid 3-keto to 3 $\alpha$ -hydroxy groups<sup>22</sup>. Two new routes from acid derivatives to aldehydes have been found: the reduction of N-methylanilides by  $\text{LiAlH}_4$ <sup>23</sup>, which can also lead to the formation of hydroxymethyl compounds, and, recently, the reduction of amidines and imidazolines with sodium and ethanol in liquid ammonia as carried out by Birch<sup>24</sup>.

Aromatic aldehydes and alkyl aryl ketones can be synthesized by the reaction of diazonium salts with oximes (9, 868). Mannich bases may be converted into the corresponding aldehydes via nitrones (9, 553) or, directly, with hexamethylenetetramine<sup>25</sup>. N-Bromoacetamide has proved highly selective in the oxidation of certain *sec.* hydroxyl groups, e.g. at the 3 position of steroids<sup>26</sup>. Another way of achieving this oxidation is by catalytic dehydrogenation with platinum and either oxygen or air<sup>27</sup>. Bachmann et al. convert *prim.* amines into oxo compounds through N-chloramines and particularly recommend *tert*-butyl hypochlorite for N-chlorination<sup>28</sup>. Baumgarten and Bower have found a simple preparation of  $\alpha$ -aminoketones starting from *sec.* alkylamines and rearranging the corresponding N,N-dichloroamines<sup>29</sup>. There is also a convenient new procedure for regenerating oxo compounds from their 2,4-dinitrophenylhydrazones<sup>30</sup>, derivatives used most frequently for purposes of isolation and characterization.

Alkali sensitive and slow reacting  $\alpha$ -diazoketones can be converted successfully into acids and esters by irradiation<sup>31</sup>. N-Methyl-N-cyano-

aniline has been recommended for the introduction of cyano groups (9, 865).

Previously inaccessible hydroperoxides may be obtained from mesylates (9, 166).

There are several new methods of achieving N-alkylation: Acylamines may be reduced with  $\text{LiAlH}_4$ <sup>21</sup> (9, 113) or  $\text{LiBH}_4$ <sup>32</sup>. Methylamines, in particular, can be obtained by  $\text{LiAlH}_4$ -reduction of urethans<sup>33</sup> or isocyanates (8, 95). Gerrard and Jeacocke<sup>34</sup> obtain subst. anilines by the pyrolysis of anilinophosphates. Selective N-alkylation, especially of amido groups, can be performed in acetone in the presence of KOH.

Chloral has been recommended for the formylation of strong organic bases (9, 545).

A new and stable reagent for making diazomethane, p-toluene-sulfonylmethylnitrosamide<sup>35</sup>, is already commercially available.

Continuing their work with phosphites, Rydon et al. have published an even simpler method of obtaining halides from alcohols<sup>36</sup>. Polyphosphoric acid, this very versatile reagent, makes possible the direct conversion of acids to  $\alpha$ -bromoacids<sup>37</sup>. Diiodoacetylene has been recommended for the preparation of iodides<sup>38</sup>.

A new synthesis of thiophenols using 2,4-dinitrobenzenesulfonyl chloride for the introduction of SH-groups into aromatic nuclei has been found<sup>39</sup>. S-Thiocarbonic acid esters proved to be convenient intermediates for the preparation of ureas, acylureas, and semi-carbazides (9, 536). Stabilized liquid  $\text{SO}_3$ , e.g. the commercially available Sulfan, is a promising reagent for sulfonations and sulfations<sup>40</sup>.

In the Friedel-Crafts ketone synthesis, elimination of HCl by a stream of air has been suggested<sup>41</sup>. In specific instances,  $\text{TiCl}_4$  may be preferable to  $\text{AlCl}_3$ <sup>42</sup>. The alkylation and acylation of ketones via enamines may be applied to compounds with base sensitive groups (9, 912). Amino acids are recommended as catalysts in the Knoevenagel

<sup>42</sup> *Synth. Meth.* 7, 800; *Soc.* 1954, 2942.

condensation <sup>43</sup>. One advantage is that they facilitate the isolation of the product. Intermolecular ring closure can be achieved without using the high dilution technique ordinarily required when polycondensation is inhibited by steric hindrance (9, 513). The use of trichloroacetic esters opens up a new way of synthesizing 3-subst. 2-oxazolidones and related heterocyclics <sup>44</sup>.

Braude et al. tested 11 quinones as dehydrogenation agents and found dicyanoquinone rather than chloranil to be the most effective <sup>45</sup>.

Dehydrations have been carried out with carbodiimides (9, 184), already mentioned as reagents in peptide chemistry. Sulfonic acid anhydrides <sup>46</sup> and nucleotides <sup>47</sup> have thus been made readily available. Methoxyacetylene has also been used for dehydrations (9, 261). Alkoxyacetylenes <sup>48</sup>, in general, are among the more interesting compounds that recently appeared in the literature. Here are a few others: *tert*-Nitroparaffins <sup>49</sup>, 2,4,6-tri-*tert*-butylphenoxyl <sup>50</sup>, a stable oxygen radical, tritium-labeled compounds <sup>51</sup>, non-classical aromatic compounds, the best known of which are the ferrocenes <sup>52</sup>, and diketene, which has been the subject of a series of papers <sup>53</sup>.

Ethylene oxide is a suitable means of removing hydrogen halides <sup>54</sup>.

Resins have been used successfully as reagents by Billimoria and MacLagan <sup>55</sup>. In addition to hydrating the carbon-carbon triple bond with a mercury resin, as was done by Newman (9, 102), they hydrolyze  $\alpha$ -ketobromides with a basic ion-exchange resin. Dowex-50 has been used to remove sodium from a liquid ammonia solution (9, 42). Nucleotides have been hydrolyzed with Dowex-50-H<sup>+</sup> <sup>56</sup>.

Future developments will show whether electric discharge as a means of gently initiating reactions will find wider application. 9, 198 illustrates its use in the preparation of phenol from benzene.

## Formation of H—O Bond

### Uptake

#### Addition to Oxygen

*Lithium aluminum hydride*

#### Diols from peroxides

s. 9, 6

$\text{LiAlH}_4$

#### Addition to Oxygen and Carbon

*Zinc/acetic acid*

#### Quinols from quinones

$\text{Zn/CH}_3\text{COOH}$

←

1.

2,5-Di-*t*-butylquinone refluxed with excess Zn-dust and 80%-acetic acid  $\rightarrow$  2,5-di-*t*-butylhydroquinone. Y: 95%. H. M. Crawford, M. Lumpkin, and M. McDonald, *Am. Soc.* 74, 4087 (1952).

*Lithium aluminum hydride*

$\text{LiAlH}_4$

#### 2-Acylamino-3-aryl-2-propen-1-ols from azlactones

C

#### Reductive oxazolone ring opening

2.

2-Phenyl-4-(*p*-methoxybenzylidene)oxazolone allowed to react with  $\text{LiAlH}_4$  in tetrahydrofuran at  $-65$  to  $-35^\circ \rightarrow$  2-benzoylamino-3-(*p*-methoxyphenyl)-2-propen-1-ol.—The lower temp. is maintained until the reactants are mixed. Y: 81%. F. e. s. E. Baltazzi and R. Robinson, *Chem. and Ind.* 1953, 541.

*Hydrosulfite*

$\text{S}_2\text{O}_4^{--}$

#### Quinols from quinones

←

s. 5, 3; s. a. G. A. Reynolds and J. A. VanAllan, *Org. Synth.* 34, 1 (1954)

s. 2, 151; s. a. R. H. Eastman and J. C. Selover, *Am. Soc.* 76, 4118 (1954)

**Rearrangement****Oxygen/Carbon Type** $\text{HO} \downarrow \text{OC}$ *Without additional reagents**w.a.r.***Tropolones by enolization** $\text{CHCO} \rightarrow \text{C}:\text{C}(\text{OH})$ 

3.

3-Bromo-4,5-benzocyclohepta-4,6-diene-1,2-dione heated at 90-95° → 3-bromo-4,5-benzotropolone. Y: ca. 100%. H. Fernholz, E. Hartwig, and J. C. Salfeld, *A.* 576, 131 (1952).

*Hydrobromic acid* $\text{HBr}$ **Phenol acetates from dienones**

←

**Tropolones from cyclic diene- $\alpha$ -diones**

4.

A mixture of glacial acetic acid satd. with  $\text{HBr}$ , acetic anhydride, and 2,6-dibenzylidenecyclohexanone heated 12 hrs. at 70° → 2,6-dibenzylphenyl acetate. Y: 84%.

3,7-Dibenzylidene-1,2-cycloheptanedione and a little benzoyl peroxide added to glacial acetic acid satd. at 30° with  $\text{HBr}$ , and heated 11 hrs. at 60° → crude 3,7-dibenzyltropolone. Y: 46%.—If the benzoyl peroxide is omitted, the crude product is less readily purified. N. J. Leonard and G. C. Robinson. *Am. Soc.* 75, 2143 (1953); cf. *Synth. Meth.* 9, 5.

Palladium-carbon

Pd-C

**Tropolones from cyclic diene- $\alpha$ -diones**

5. The use of Pd-on-charcoal as catalyst and triethylene glycol as solvent gives higher yields and is a more general method than the use of HBr/acetic acid (cf. Synth. Meth. 9, 4).—E: 3,7-Dibenzylidene-1,2-cycloheptanedione  $\rightarrow$  3,7-dibenzyltropolone. Y: 90%. F. e. s. N. J. Leonard and J. W. Berry, Am. Soc. 75, 4989 (1953).

**Exchange****Oxygen  $\uparrow$** **HO  $\uparrow$  O**

Lithium aluminum hydride

LiAlH<sub>4</sub>

Alcohols from alkyl- and acyl peroxides

 $\leftarrow$ 

Diols from photooxides

6.

Dibenzoyl peroxide in dry ether added slowly with stirring to LiAlH<sub>4</sub> in ether, and refluxed 30 min.  $\rightarrow$  benzyl alcohol. Y: 87.5%.—Similarly: Methyl  $\alpha$ -tetralyl peroxide refluxed 2.5 hrs.  $\rightarrow$  crude  $\alpha$ -tetralol. Y: 95%. F. e. s. M. Matic and D. A. Sutton, Soc. 1952, 2679; s. a. G. A. Russell, Am. Soc. 75, 5011 (1953); diols from cyclic peroxides, in particular, s. A. Mustafa, Soc. 1952, 2435.

**Nitrogen  $\uparrow$** **HO  $\uparrow$  N**

Sodium sulfide

Na<sub>2</sub>S

Cleavage of carbohydrate nitrates

ONO<sub>2</sub>  $\rightarrow$  OH

7. A soln. of methyl 2-methyl-4,6-propylidene- $\alpha$ -D-glucoside 3-nitrate in alcohol treated with Na<sub>2</sub>S at room temp. for 24 hrs.  $\rightarrow$  methyl 2-methyl-4,6-propylidene- $\alpha$ -D-glucoside. Y: 78%. E. G. Ansell and J. Honeyman, Soc. 1952, 2778.

**Halogen  $\uparrow$** **HO  $\uparrow$  Hal**

Sodium

Na

Ethylenealcohols from cyclic halogenoethers

 $\cap$ 

s. 6, 6; introduction of isoprene units s. W. E. Parham and H. E. Holmquist, Am. Soc. 76, 1173 (1954); prim. enynols s. O. Riobè, C. r. 236, 2073 (1953)

## Butylsodium

## Acetylenealcohols from cyclic halogenoethers

8.

3-Bromodihydropyran in petroleum ether added in one portion at  $0^\circ$  to butyl-Na prepared from butyl chloride and Na in the same solvent in the presence of a little 1-butanol, and stirring continued 2.5 hrs. with occasional cooling  $\rightarrow$  4-pentyn-1-ol. Y: 87%. F. e. s. R. Paul and S. Tchelitcheff, *Bl.* 1952, 808.

## Sodium amide

9.

Tetrahydrofurfuryl chloride added with stirring during 25-30 min. to  $NaNH_2$ , prepared from Na and liq.  $NH_3$  in the presence of  $Fe(NO_3)_3$ , and stirring continued for 1 hr.  $\rightarrow$  4-pentyn-1-ol. Y: 75-85%. E. R. H. Jones, G. Eglinton, and M. C. Whiting, *Org. Synth.* 33, 68 (1953).

## Sodium sulfite

## Sulfinic acids from sulfonic acid chlorides

s. 2, 5, 581; aliphatic sulfinic acids as Mg-salts s. H. Bredereck and E. Bäder, *B.* 87, 129 (1954)

## Sulfur †

## Sodium amalgam

s. 9, 203

**Carbon  $\nabla$**

HO $\nabla$ C

*Sodium hydroxide*

$\text{NaOH}$

**Hydroxymethylene compounds from alkoxymethylene compounds**

$\text{C:CHOR} \rightarrow \text{C:CHOH}$

s. 5, 5; s. a. H. Behringer and H. Weissauer. *B.* **85**, 774 (1952)

**Deacetylation**

$\text{OAc} \rightarrow \text{OH}$

s. 7, 129; 8, 165; s. a. W. R. Brasen and C. R. Hauser, *Org. Synth.* **34**, 58 (1954)

**Hydroxyacetals from acoxyacetals**

$\text{OAc} \rightarrow \text{OH}$

**Protection of hydroxyl groups**

11.

1,2-O-Hexadecylidene-3-monolaurin refluxed 6 hrs. with ethanol containing  $\text{NaOH} \rightarrow$  1,2-O-hexadecylideneglycerol. Y: ca. 100%.—Protection of the hydroxyl group by acetyl or benzoyl in place of lauroyl was not so satisfactory. M. J. Egerton and T. Malkin. *Soc.* **1953**, 2800.

**Carboxylic acids from carboxylic acid esters**

$\text{COOR} \rightarrow \text{COOH}$

s. 9, 44

**Selective hydrolysis**

12.

N  $\text{NaOH}$  soln. added at  $0^\circ$  to a soln. of N-acetyl-O-toluenesulfonylallohydroxy-DL-proline methyl ester in methanol, and the mixture kept 18 hrs. at  $0^\circ \rightarrow$  N-acetyl-O-toluenesulfonylallohydroxy-DL-proline. Y: 90%. R. Gaudry and C. Godin, *Am. Soc.* **76**, 139 (1954).

### N-Carbalkoxypeptides from N-carbalkoxypeptide esters

s. 8, 6; s. a. D. T. Gish and F. H. Carpenter, *Am. Soc.* 75, 5872 (1953); E. Sondheimer and R. W. Holley, *Am. Soc.* 76, 2816 (1954)

Potassium hydroxide

KOH

### Partial deacetylation of steroids

OAc  $\rightarrow$  OH

13.

A soln. of KOH in methanol-water added to an ice-cooled soln. of allopregnane-3 $\beta$ ,11 $\alpha$ ,21-triol-20-one triacetate in methanol under N<sub>2</sub>, and the product isolated after 1 hr. at room temp.  $\rightarrow$  allopregnane-3 $\beta$ ,11 $\alpha$ ,21-triol-20-one 11-monoacetate. Y: 78%. F. e. s. F. Sondheimer et al., *Am. Soc.* 75, 2601 (1953).

### Carboxylic acids from carboxylic acid esters

COOR  $\rightarrow$  COOH

s. 9, 159

### Polycarboxylic acids from polycarboxylic acid esters Mild hydrolysis

Tetraethyl butane-1,1,4,4-tetracarboxylate shaken 12 hrs. with aq. KOH, concentrated under reduced pressure, acidified with HCl, evaporated to dryness in vacuo below 40°, and continuously extracted with ether for 2 days  $\rightarrow$  butane-1,1,4,4-tetracarboxylic acid (startg. m. f. 982). Y: 95%. F. e. s. L. Crombie, J. E. H. Hancock, and R. P. Linstead, *Soc.* 1953, 3496.

Potassium hydroxide/alcohol

### Hydroxymercaptals from acoxymercaptals Selective hydrolysis

OAc  $\rightarrow$  OH

15.

A soln. of  $\Delta^4$ -cholestene-2 $\alpha$ -ol-3-one acetate ethylenethioketal in methanol containing KOH refluxed 1 hr.  $\rightarrow$   $\Delta^4$ -cholestene-2 $\alpha$ -ol-3-one ethylene-

thioketal. Y: 73%. L. F. Fieser and M. A. Romero, Am. Soc. 75, 4716 (1953).

**$\alpha$ -Hydroxyketones from  
1-acyoxy-1,2-oxido compounds**

←

s. 9, 202

**Carboxylic acids from carboxylic acid esters**

s. 9, 892

*Sodium/alcohol*

**Deacetylation of carbohydrates**

s. 9, 229

*Sodium/liq. ammonia*

**Partial cleavage of methyl ethers**

16.

3,4-Dimethoxyphenethylamine added slowly to a soln. of Na in liq. NH<sub>3</sub>, the mixture allowed to stand for 6 hrs. until it reaches room temp., then decomposed by cautious addition of ice  $\rightarrow$  3-hydroxy-4-methoxyphenethylamine. Y: 85%. K. E. Hamlin and F. E. Fischer, Am. Soc. 75, 5119 (1953).

*Sodium carbonate*

**Partial O-deacetylation**

s. 9, 267

*Potassium carbonate*

**Partial hydrolysis  
Deacetylation**

s. 4, 11; mandelates from acetylmandelates s. V. Prelog and H. L. Meier, Helv. 36, 320 (1953)

*Potassium hydrogen carbonate* $KHCO_3$ **Masking of hydroxyl groups****Selective hydrolysis of formoxy compounds**

17.

Formates can easily be hydrolyzed and often crystallize better than acetates.—E: 95 mg. methyl 3-keto-11 $\alpha$ -formoxyetianate (from the hydroxy compound with 99%-formic acid and acetic anhydride in pyridine) allowed to stand 3 days at 20° with  $KHCO_3$  in methanol-water  $\rightarrow$  79 mg. methyl 3-keto-11 $\alpha$ -hydroxyetianate. F. e. s. F. Reber, A. Lardon, and T. Reichstein, *Helv.* 37, 45 (1954); use of trifluoroacetyl derivatives s. *Helv.* 37, 388.

*Lithium chloride* $LiCl$ **Monodealkylation of phosphoric acid esters**

s. 7, 18; s. a. Soc. 1954, 2381

*Triton B***Carboxylic acids from carboxylic acid esters****Cinnamylidenemalonic acids**

s. 9, 828

 $COOR \rightarrow COOH$ *Barium hydroxide* $Ba(OH)_2$ **Partial hydrolysis of phosphoric acid esters**

s. 9, 189

*Lithium aluminum hydride* $LiAlH_4$ **Deacylation** $OAc \rightarrow OH$ s. 7, 20; s. a. W. A. Bonner and C. J. Collins, *Am. Soc.* 75, 5372 (1953)*Boric acid* $HBO_2$ **Selective hydrolysis****Monoglycerides**

18.

1,3-Benzylidene-2-elaidylglycerol dissolved in triethyl borate, finely powdered boric acid added, heated 3-5 min. at 100° until dissolved, most

of the solvent evaporated in vacuo (2-5 mm.), heating in vacuo at 100° continued for 10 min., cooled, the resulting boric acid ester dissolved in ether, and hydrolyzed by washing with water  $\rightarrow$  2-monoelaidin. Y: 86%. F. e., also isomerization to 1-monoglycerides, s. J. B. Martin, Am. Soc. 75, 5482 (1953).

#### Yeast

#### Disaccharides from trisaccharides

19. An aq. soln. of raffinose pentahydrate treated with Ca-carbonate and a nutrient soln. containing Na-nitrate, Mg-sulfate, and  $\text{KH}_2\text{PO}_4$ , baker's yeast added, kept 4 days at 37°, then worked up using ion-exchange resins  $\rightarrow$   $\alpha$ -melibiose. Y: 88%. H. G. Fletcher, Jr., and H. W. Diehl, Am. Soc. 74, 5774 (1952).

#### Aspergillus oryzae enzyme

#### Cleavage of glycosides

ROR  $\rightarrow$  ROH

s. 8, 14; s. a. B. 85, 1042, 1103 (1952)

#### Acetic anhydride/hydriodic acid

$(\text{CH}_3\text{CO})_2\text{O}/\text{HI}$

#### s. Hydriodic acid/acetic anhydride

#### Carboxylic acids and mercaptans

#### Acidolysis

A mixture of 2-ethoxybenzothiazole (prepn. s. 834) and benzoic acid heated 24 hrs. at 170° with vigorous stirring in a dry  $\text{N}_2$ -atmosphere  $\rightarrow$  2-hydroxybenzothiazole (Y: 85%) and ethyl benzoate (Y: 77%). F. e. s., also thioethers with mercaptans. s. H. Gilman, K. E. Lentz, and J. A. Beel, Am. Soc. 74, 1081 (1952).

#### Acetic acid

$\text{CH}_3\text{COOH}$

#### Cleavage of acetals

s. 9, 303

**Selective hydrolysis.** A mixture of 3-acetyl-4,5-isopropylidenedihydroshikimate, acetic acid, methanol, and water refluxed 3 hrs., concentrated in vacuo, and the acetic acid removed by concentrating in vacuo three times after addition of alcohol  $\rightarrow$  methyl 3-acetyldihydroshikimate.

Y: 82%. F. e. s. K. Freudenberg and J. Geiger, A. 575, 145 (1952); s. a. R. Grewe and E. Nolte, A. 575, 1 (1952); carbohydrate derivatives s. S. B. Baker, Am. Soc. 74, 827 (1952).

*Hypophosphorous acid/hydrobromic acid*  
*s. Hydrobromic acid/hypophosphorous acid*

 $H_3PO_2/HBr$ 

*p-Toluenesulfonic acid*

 $TsOH$ 

**Removal of protective groups**

 $ROR \rightarrow ROH$ 

**Cleavage of tetrahydro-2-pyranyl ethers**

22.

A soln. of 1,10-bis(tetrahydro-2'-pyranloxy)deca-2,8-diene-4,6-diyne and a small amount of *p*-toluenesulfonic acid in alcohol refluxed 1 hr.  $\rightarrow$  deca-2,8-diene-4,6-diyne-1,10-diol. Y: almost 100%. F. e. s. R. Ahmad and B. C. L. Weedon, Soc. 1953, 3286.

*Sulfuric acid*

 $H_2SO_4$ 

**Partial cleavage of methyl ethers**

23.

A mixture of 3,4,5-trimethoxybenzaldehyde and concd.  $H_2SO_4$  kept 8 hrs. at  $40^\circ$ , then allowed to stand at room temp. overnight  $\rightarrow$  syringaldehyde. Y: 96%. I. A. Pearl and D. L. Beyer, Am. Soc. 74, 4262 (1952); s. a. K. Aghoramurthy and T. R. Seshadri, Soc. 1954, 3065.

**Aldehydes from 1,1-diacoxy compounds**

 $CH(OAc)_2 \rightarrow CHO$ 

s. 9, 251

**N-Alkylation of oxazolidiones**

**Blocking of carboxyl groups**

**by formation of tert-butyl esters**

**Hydrolysis of carboxylic acid esters**

**under anhydrous conditions**

 $COOR \rightarrow COOH$ 

*Tert*-butyl bromoacetate added with swirling during 15 min. to a soln. of the Na-salt of 5-phenyl-2,4-oxazolidione in dimethylformamide, al-

lowed to stand overnight, the resulting crude 3-carbo-*tert*-butoxy-methyl-5-phenyl-2,4-oxazolidione dissolved in concd.  $\text{H}_2\text{SO}_4$ , then cooled and dil. with water  $\rightarrow$  3-carboxymethyl-5-phenyl-2,4-oxazolidione. Y: 87.3%.—*Tert*-butyl esters, which can be cleaved under anhydrous conditions, may be used to block carboxyl groups in sensitive compounds. Also hydrolysis with HCl-gas in dioxane s. J. C. Sheehan and G. D. Laubach, Am. Soc. 73, 4752 (1951).

#### Hydrochloric acid

HCl

#### Alcohols from alkoxymethyl ethers

ROR  $\rightarrow$  ROH

s. 9, 270

#### Cleavage of acetals

s. 9, 318

#### Cleavage of benzylidene derivatives of carbohydrates

s. 9, 355

#### Oxo compounds from acetals

 $\text{C(OR)}_2 \rightarrow \text{CO}$ 

s. 9, 665, 743, 903

#### Deacetylation

OAc  $\rightarrow$  OH

s. 7, 27; partial deacetylation s. E. P. Oliveto et al., Am. Soc. 75, 5486 (1953); A. Lardon and T. Reichstein, Pharm. Acta Helv. 27, 287 (1952); large batches s. H. H. Inhoffen, H. Jahnke, and P. Nehring, B. 87, 1154 (1954)

#### Ethylenecarboxylic acids from hydroxycarboxylic acid esters

COOR  $\rightarrow$  COOH

*t*-Butyl  $\beta$ -hydroxy- $\beta$ -phenylpropionate refluxed 1.5 hrs. in concd. HCl-dioxane  $\rightarrow$  cinnamic acid. Y: 96%. F. e. s. C. R. Hauser and W. H. Puterbaugh, Am. Soc. 75, 1068 (1953).

#### Carboxylic acids from carboxylic acid esters

##### Selective hydrolysis

##### N-Thiocarbonylaminocarboxylic acids

A suspension of phenylthiocarbonylglycine ethyl ester in a 1:1 mixture of glacial acetic acid and concd. HCl refluxed 10 min.  $\rightarrow$  phenylthiocarbonylglycine. Y: 89%. F. e. s. A. Lindenmann, N. H. Khan, and K. Hofmann, Am. Soc. 74, 476 (1952).

**Carboxylic acids from carboxylic acid esters****Acidolysis**

at room temp. s. 6, 25; at reflux temp. s. K. Schlögl, F. Wessely, and G. Korger, M. 83, 493 (1952)

**Dicarboxylic acid monoesters from dicarboxylic acid diesters****Acidolysis**

Dimethyl  $\beta,\beta,\beta',\beta'$ -tetramethylsuberate refluxed with concd. HCl and an equimolecular quantity of acetic acid, methyl acetate removed as formed through a short column until 0.33 equivalent has distilled, further reaction stopped by adding benzene, the water removed by azeotropic distillation, and the procedure repeated several times with a mixture of tetramethylsuberic acid, obtained as by-product, and unchanged dimethyl ester  $\rightarrow$  methyl hydrogen  $\beta,\beta,\beta',\beta'$ -tetramethylsuberate. Y: 83%. S. F. Birch et al., Soc. 1952, 1363.

*Hydrobromic acid/hypophosphorous acid*

$\text{HBr}/\text{H}_3\text{PO}_2$

**Cleavage of methyl ethers**

$\text{ROR} \rightarrow \text{ROH}$

1-Isopropyl-6,7-dimethoxy-1,2,3,4-tetrahydroisoquinoline (prepn. s. 84) heated with 10% excess 48% HBr containing a little hypophosphorous acid, whereby the temp. reaches 126° after removal of the aq. forerun, and the product isolated after 1-3 hrs. when the evolution of methyl bromide ceases  $\rightarrow$  1-isopropyl-6,7-dihydroxy-1,2,3,4-tetrahydroisoquinoline. Y: 90%. F. e. s. P. N. Craig et al., Am. Soc. 74, 1316 (1952).

*Hydriodic acid/acetic anhydride*

$\text{HI}/(\text{CH}_3\text{CO})_2\text{O}$

HI (d. 1.7) added to a soln. of 0.5 g. 5-methoxy-6-hydroxy-4-methylcoumarin (prepn. s. 199) in acetic anhydride, and refluxed 2 hrs. in an oil bath at 130-140°, then poured into  $\text{NaHSO}_3$ -soln.  $\rightarrow$  0.4 g. 5,6-dihydroxy-4-methylcoumarin. V. J. Dalvi, R. B. Desai, and S. Sethna, J. Indian Chem. Soc. 28, 366 (1951).

69.

An ethereal soln. of diosgenin satd. at room temp. with anhydrous  $\text{HCl}$ .  $\text{LiAlH}_4$  in pea-size amounts then added with vigorous stirring, sufficient time being allowed for each piece to react before the next piece is added, and gently refluxed for 2 hrs., excess  $\text{HCl}$  being maintained throughout the reaction  $\rightarrow$  dihydrodiosgenin. Y: 90%. F. e., also with  $\text{HBr}$ . s. H. M. Doukas and T. D. Fontaine, Am. Soc. 75, 5355 (1953).

**Reductions with***Sodium trimethoxyboron hydride* $\text{NaBH}(\text{OCH}_3)_3$ **Alcohols from oxo compounds** $\text{CO} \rightarrow \text{CHOH}$ 

Sodium trimethoxyboron hydride readily reduces aldehyde, ketone, acid chloride, and acid anhydride groups. Ester and nitrile groups are only slowly reduced at elevated temp., whereas the carboxylate group does not appear to react. The nitro group is not reduced at lower temp., but undergoes reaction at 140°. Double bonds appear stable, even when conjugated with a carbonyl group. At low temp. sodium trimethoxyboron hydride in stoichiometric amounts appears to react with acid chlorides to form aldehydes.—E: Cinnamaldehyde added to a mixture of Na-trimethoxyboron hydride and ether, whereby refluxing sets in, which is continued for 4 hrs. by external heating  $\rightarrow$  cinnamyl alcohol. Y: 79%. F. e. s. H. C. Brown and E. J. Mead, *Am. Soc.* 75, 6263 (1953).

F. reductions with Raney-Ni s. G. D. Laubach and K. J. Brunings, Am. Soc. 74, 705 (1952).

### Ring hydrogenation of phenols

s. 4, 76-8; s. a. K. W. Rosenmund and H. Herzberg, B. 87, 1575 (1954)

Nickel-aluminum

Ni, Al

### Carboxylic acids from ethylenecarboxylic acids

s. 5, 52; s. a. G. A. Page and D. S. Tarbell, Org. Synth. 34, 8 (1954)

Nickel/chloroform

Ni/ $CHCl_3$

### Ketones from ethyleneketones

91.

Benzylideneacetone hydrogenated with Raney-Ni from 50%-alloy in the presence of chloroform (trace of HCl)  $\rightarrow$  benzylacetone. Y: 86% as the oxime. R. Cornubert and J. Phéllisse, Bl. 1952, 403, 407, 410; prepn. of the catalyst s. Bl. 1952, 399.

Nickel-silica

Ni- $SiO_2$

### Benzene ring hydrogenation

92.

1,6-Diphenylhexane and Ni-kieselguhr catalyst in methylcyclohexane hydrogenated at 180-190° and 1700 p. s. i.  $\rightarrow$  1,6-dicyclohexylhexane. Y: 94%. F. e. s. K. T. Serijan and P. H. Wise, Am. Soc. 73, 5191, 4766 (1951); s. a. J. H. Lamneck, Jr., and P. H. Wise, Am. Soc. 76, 3475 (1954).

Ruthenium dioxide

$RuO_2$

### Ring hydrogenation of amines

93. A mixture of bis-(4-aminophenyl)methane, dioxane, and  $RuO_2$  charged into an autoclave, repeatedly pressured to 200 lbs./sq. in. with  $H_2$  and purged to remove air, then hydrogenated 4 hrs. at 100-120° and 166-200 atm.  $\rightarrow$  bis-(4-aminocyclohexyl)methane. Y: 92%. A. E. Barkdoll et al., Am. Soc. 75, 1156 (1953); formulas, cf. Synth. Meth. 8, 69.

*Palladium-calcium carbonate**Pd-CaCO<sub>3</sub>***Hydrogenation of acetylene derivatives**

s. 9, 101

*Palladium-barium sulfate**Pd-BaSO<sub>4</sub>***Hydrogenation of ethylene derivatives**C:C  $\rightarrow$  CHCH

s. 3, 46; of cinnamic acid esters s. J. R. Catch, H. P. W. Huggill, and A. R. Somerville, Soc. 1953, 3028

*Palladium-carbon**Pd-C***Ketones from ethyleneketones****Stereochemistry of steroids**

94.

A mixture of 0.5 g.  $\Delta^8$ -22a-5 $\alpha$ -spirosten-3 $\beta$ -ol-11-one propionate, 10%-Pd-carbon, and ethanol hydrogenated 20 hrs. at room temp. and atmospheric pressure  $\rightarrow$  0.35 g. 22a-5 $\alpha$ -8-iso( $\alpha$ )-spirostan-3 $\beta$ -ol-11-one propionate.—Chemical reduction with Li in liq.  $\text{NH}_3$  furnishes the trans(8 $\beta$ ,9 $\alpha$ )-isomer. F. e. s. C. Djerassi et al., Am. Soc. 75, 3496 (1953).

**Ethylene from acetylene derivatives**C:C  $\rightarrow$  CH:CH

95.

6-Methoxy-4-methyl-2-hexyn-1,4-diol hydrogenated 2.5-3 hrs. with 17%-Pd-on-charcoal in abs. alcohol until 1 equivalent of  $\text{H}_2$  has been absorbed  $\rightarrow$  6-methoxy-4-methyl-2-hexen-1,4-diol. Y: 75-85%. F. e. s. M. S. Newman, I. Waltcher, and H. F. Ginsberg, J. Org. Chem. 17, 962 (1952).

**Selective hydrogenation**C:C  $\rightarrow$   $\text{CH}_2\text{CH}_2$ 

96.

of acetylene derivatives. Hydrogenation can be performed selectively by suitable catalyst-solvent combinations.—E: A soln. of ethynyltesto-

sterone in purified dioxane hydrogenated with 5%-Pd-on-charcoal until the  $H_2$ -uptake practically ceases after 2 moles have been absorbed  $\rightarrow$  17-ethyltestosterone. Y: 80%. F. e. s. E. B. Hershberg et al., Am. Soc. 73, 5073 (1951).

*Palladium-carbon/sodium hydroxide*

*Pd-C/NaOH*

**Carboxylic acids from  
 $\alpha,\beta$ -ethylenecarboxylic acids**

from 1,1-bromonitro compounds**

s. 9, 168

*Lithium aluminum hydride***Replacement of halogen by hydrogen**

s. 9, 108

**2-Ethylenealcohols from  
 $\alpha,\beta$ -ethylenecarboxylic acid chlorides**

33.

An ethereal soln. of 12% excess  $\text{LiAlH}_4$  added dropwise at  $-20^\circ$  to an ethereal soln. of *trans*-2-octadecenoic acid chloride, stirring continued 1 hr. at  $-16^\circ$  and 30 min. at  $20^\circ \rightarrow$  *trans*-2-octadecen-1-ol. Y: 80%.—The free acid and the ester give mostly the saturated alcohol. E. F. Jenny and C. A. Grob, *Helv.* 36, 1936 (1953).

*Ethyl alcohol***Disproportionation**

34.

A soln. of di-(*p*-methoxyphenyl)methyl chloride in 96%-ethanol refluxed 6 hrs. in a slow  $\text{CO}_2$ -stream  $\rightarrow$  di-(*p*-methoxyphenyl)methane (Y: 80%) and acetaldehyde (Y: 75% as the 2,4-dinitrophenylhydrazone). F. e. with alcohols s. M. P. Balfe, J. Kenyon, and E. M. Thain. *Soc.* 1952, 790.

*Chromous chloride***Replacement of halogen by hydrogen**

s. 4, 112; s. a. J. J. Beereboom and C. Djerassi, *J. Org. Chem.* 19, 1196 (1954)

*Hydriodic acid***Replacement of chlorine by hydrogen**

35.

A soln. of picryl chloride in acetone added to a soln. of  $\text{NaI}$  in acetone containing acetic acid, allowed to stand 24 hrs. at room temp., then

poured into aq.  $\text{NaHSO}_3 \rightarrow$  trinitrobenzene. Y: 60% (crude Y: up to 100%). A. H. Blatt and E. W. Tristram, *Am. Soc.* **74**, 6273 (1952); purine derivatives s. R. K. Robins and B. E. Christensen, *Am. Soc.* **74**, 3624 (1952).

*Nickel*

*Ni*

### Replacement of iodine by hydrogen

$\text{I} \rightarrow \text{H}$

136.

Raney-Ni satd. with  $\text{H}_2$  added to a soln. of 3 $\beta$ -acetoxy-11 $\beta$ -hydroxy-12 $\alpha$ -iodo-5 $\alpha$ ,22 $\alpha$ -spirostane in dioxane-ether and stirred 23 hrs. at 0-5° in the dark  $\rightarrow$  3 $\beta$ -acetoxy-11 $\beta$ -hydroxy-5 $\alpha$ ,22 $\alpha$ -spirostane. Y: 93.0%. J. Schmidlin and A. Wettstein, *Helv.* **36**, 1241 (1953).

*Palladium-calcium carbonate/pyridine*

*Pd-CaCO<sub>3</sub>/C<sub>5</sub>H<sub>5</sub>N*

### Hydrocarbons from $\alpha,\beta$ -ethylenechlorides

$\text{C}:\text{CCl} \rightarrow \text{CHCH}_2$

### Selective hydrogenation

137.

Ethyl 5-chloro-1,1-dimethyl-3-oxo-4-cyclohexene-2-carboxylate hydrogenated in alcohol with prehydrogenated 2.5%-Pd-CaCO<sub>3</sub> in the presence of pyridine until 10% more than the calculated amount of  $\text{H}_2$  has been absorbed  $\rightarrow$  ethyl 1,1-dimethylcyclohexan-3-one-2-carboxylate. Y: 90%. U. Steiner and B. Willhalm, *Helv.* **35**, 1752 (1952); f. e. s. H. Favre and H. Schinz, *Helv.* **35**, 2388 (1952).

*Palladium-strontium carbonate*

*Pd-SrCO<sub>3</sub>*

### Replacement of halogen by hydrogen

$\text{Hal} \rightarrow \text{H}$

s. 7, 128; s. a. B. H. Chase and J. Walker, *Soc.* 1953, 3548

*Palladium-barium sulfate*

*Pd-BaSO<sub>4</sub>*

### Aldehydes from carboxylic acid chlorides

$\text{COCl} \rightarrow \text{CHO}$

s. 1, 100/1; s. a. K. Freudenberg and H. H. Hübner, *B.* **85**, 1181 (1952); J. P. Lambooy, *Am. Soc.* **76**, 133 (1954); K. Balenović et al., *J. Org. Chem.* **18**, 297 (1953)

*Palladium-barium sulfate/calcium carbonate**Pd-BaSO<sub>4</sub>/CaCO<sub>3</sub>***Replacement of bromine by hydrogen**

Br → H

38.

H<sub>2</sub> passed at 60° through a mixture of trimethyl δ-bromo-β-carboxyadipate, Pd-BaSO<sub>4</sub>, CaCO<sub>3</sub>, and 90%-methanol, as long as CO<sub>2</sub> is formed → trimethyl β-carboxyadipate. Y: 85%. K. Freudenberg and J. Geiger, A. 575, 145 (1952).

*Palladium-carbon**Pd-C*
**Replacement of halogen by hydrogen  
simultaneously amines from diazo compounds**

←

s. 9, 876

**Sulfur †****HC††S***Sodium amalgam**Na,Hg*
**Reductive cleavage of sulfones  
to hydrocarbons and sulfinic acids**
RSO<sub>2</sub>R' → RH + HSO<sub>2</sub>R'

139.

p-Tolyl 2,4,6-trimethoxydiphenylmethyl sulfone in ethanol refluxed 4 hrs. with 6%-Na,Hg → 2,4,6-trimethoxydiphenylmethane (Y: 88%) and Na-p-toluenesulfinate.—A necessary condition for this reaction seems to be that the SO<sub>2</sub>-group is attached to at least one ar. radical. The hydrocarbon is derived from the radical of more pronounced electron-releasing character. F. e. s. R. E. Dabby, J. Kenyon, and R. F. Mason, Soc. 1952, 4881.

Piperidine

 $C_5H_{11}N$ 

## Cleavage of azosulfonylthioethers

140.

Phenylazo(methylthio)bis(methylsulfonyl)methane

heated in HCl-alcohol-water  $\rightarrow$   
 methylthiobis(methylsulfonyl)-  
 methane. Y: 87%.

heated to boiling in piperidine  
 $\rightarrow$  phenylazobis(methylsul-  
 fonyl)methane. Y: 91%.

Also removal of a methylsulfonyl group s. H. J. Backer. R. 70, 892 (1951).

## Cleavage of sulfonylnitro compounds

141.

1,1-Bis(methylsulfonyl)-1-nitroethane and piperidine in dioxane warmed 1 min. at  $70^\circ \rightarrow$  1-methylsulfonyl-1-nitroethane (Y: 86%) and 1-methylsulfonylpiperidine (Y: 75%). H. J. Backer, R. 71, 740 (1952).

Zinc amalgam

 $\text{Zn,Hg}$ 

## Ketones from ketothioethers

142.

A soln. of thiacycloheptadecane-3,16-dione in acetic acid-concd. HCl refluxed several hrs. with Zn-amalgam on a steam bath, while more HCl is added each hr., until  $\text{H}_2\text{S}$  is no longer evolved, and allowed to stand overnight  $\rightarrow$  2,15-hexadecanedione. Y: 91%.—If the reaction is interrupted at the right time to prevent the diketone from further reduction, the yield is very high. F. e. s. T. Bacchetti and L. Canonica, G. 82, 243 (1952).

Lithium aluminum hydride

 $\text{LiAlH}_4$ **Methylamines from isothiocyanates** $\text{N:C:S} \rightarrow \text{NHCH}_3$ 

43.

A soln. of phenylisothiocyanate in abs. ether added dropwise during 40 min. to an ethereal soln. of  $\text{LiAlH}_4$ , whereby the ether starts boiling, refluxed 30 min. after the addition  $\rightarrow$  crude N-methylaniline. Y: 78%. W. Ried and F. Müller, B. 85, 470 (1952).

Sulfuric acid

 $\text{H}_2\text{SO}_4$ **Desulfonation** $\text{SO}_3\text{H} \rightarrow \text{H}$ 

s. 9, 306

Nickel

Ni

**Hydrocarbons from thioethers** $\text{RSR}' \rightarrow \text{RH}$ 

44.

A soln. of *exo*-5,8-epoxy-9,10-*cis*-di(ethylthiomethyl)-*cis*-2,3-dihydroxy-decalin in 95%-ethanol stirred at reflux with Raney-Ni W 6 (s. Org. Synth. 29, 24 (1949)) under  $\text{N}_2$  for 1 hr.  $\rightarrow$  *exo*-5,8-epoxy-9,10-*cis*-dimethyl-*cis*-2,3-dihydroxydecalin. Y: 75%. G. Stork et al., Am. Soc. 75, 384 (1953).

**Replacement of alkylthio groups by hydrogen in pyrimidines**

s. 8, 123; s. a. B. R. Baker, J. P. Joseph, and R. E. Schaub, J. Org. Chem. 19, 631, 638 (1954)

**Hydrocarbons from sulfones and thioethers**

←

**Stereochemistry of reductive desulfuration**

145.

The optical activity of sulfones with an asymmetric center adjacent to the S-atom is retained in reductive desulfuration; the respective thioethers, however, are completely racemized.—E:

(+)-2-Phenyl-2-benzenesulfonylpropionamide

(+)-2-Phenyl-2-phenylmercaptopropionamide

refluxed 5 hrs. with Mozingo-Raney-Ni in ethanol →

(+)-2-phenylpropionamide.

Crude Y: 100%.

optically inactive 2-phenylpropionamide. Crude Y: 93%.

F. e. s. W. A. Bonner, Am. Soc. 74, 1034 (1952).

CrO<sub>3</sub>**Ketolactols from ketoöxido compounds**

←

200.

A soln. of methyl 3-keto-9 $\alpha$ -11 $\alpha$ -oxidoetiocholanate in acetic acid treated with water and CrO<sub>3</sub> at room temp. for 17 hrs.  $\rightarrow$  methyl 3 $\beta$ -hydroxy-3 $\alpha$ ,9 $\alpha$ -oxido-11-ketoetiocholanate. Y: 70.5%. H. Heymann and L. F. Fieser, Am. Soc. 74, 5938 (1952).

Potassium manganate and permanganate

K<sub>2</sub>MnO<sub>4</sub> and KMnO<sub>4</sub>**Tert. hydroxycarboxylic acids from carboxylic acids**H  $\rightarrow$  OH

201.

An aq. soln. of K-permanganate and KOH added dropwise at ca. 40° during ca. 20 min. to  $\alpha$ -phenylpropionic acid in concd. aq. KOH, the resulting green soln. cooled in ice, and shaken with SO<sub>2</sub> until colorless  $\rightarrow$   $\alpha$ -phenyllactic acid. Y: 90%. (Soc. 1953, 2129.)—Optically active acids are completely racemized by this procedure, but retain their optical activity by oxidation with K-manganate in dil. alkalin soln. (Soc. 1953, 3580). The most satisfactory method of preparing tert.  $\gamma$ -hydroxycarboxylic acids is by a combination of the two procedures, whereby by suitable adjustment of the alkali concentration the 2 stages in reduction, MnO<sub>4</sub>'  $\rightarrow$  MnO<sub>4</sub>''  $\rightarrow$  MnO<sub>2</sub>, are consecutive and not simultaneous (Soc. 1953, 2129). F. e. with both procedures and their combination s. J. Kenyon and M. C. R. Symons, Soc. 1953, 2129, 3580.

SOCl<sub>2</sub>/NaOR

263.

SOCl<sub>2</sub> added dropwise during 1 hr. with stirring to picolinic acid, refluxed 1 hr. with stirring, allowed to stand overnight, abs. methanol added to the rapidly stirred mixture, then a soln. of commercial 95%-Na-methoxide in methanol added slowly, and refluxed 30 min. with stirring → methyl picolinate. Y: 73.3-82%. R. Levine and J. K. Sneed, Am. Soc. 73, 5614 (1951).

*p*-Toluenesulfonic acid

TsOH

Ethers

ROR

264.

A mixture of thiodiglycol, 100%-excess isoamyl alcohol, and *p*-toluenesulfonic acid monohydrate refluxed 4 hrs. with stirring and separation of the water formed → bis-(2-isoamoxyethyl) sulfide. Y: 83%. F. e. s. F. Richter et al., Am. Soc. 74, 4076 (1952).

Enolethers

C:C(OR)

s. 6, 215; s. a. A. Eschenmoser, J. Schreiber, and S. A. Julia, Helv. 36, 482 (1953)

 $\alpha,\beta$ -Ethyleneacetals fromCHO → CH(OR)<sub>2</sub> $\alpha,\beta$ -ethylenealdehydes

265.

A soln. containing acrolein, abs. ethanol, Skellysolve F, and a trace of *p*-toluenesulfonic acid monohydrate refluxed 24 hrs. while the water formed is collected in a water separator → acrolein diethyl acetal. Y: 62.6-82%. D. I. Wisblat et al., Am. Soc. 75, 5893 (1953).

### $\alpha$ -Ketoacetals from $\alpha$ -hydroxymethyleneketones

A soln. of 2-hydroxymethylene-3-carbethoxy-4-(3',4'-dimethoxyphenyl)-6,7-dimethoxy-1-tetralone, ethylene glycol, and p-toluenesulfonic acid in dry toluene refluxed 3 hrs. with separation of the water formed  $\rightarrow$  ethylene acetal. Y: 51%. G. N. Walker, Am. Soc. 75, 3393 (1953).

### Blocking of keto groups by formation of alkylene ketals

s. 6, 216; s. a. H. H. Inhoffen and J. Kath, B. 87, 1589 (1954)

### Acetylation Partial-O-deacetylation 11 $\beta$ -Acetoxysteroids

A small amount of p-toluenesulfonic acid added to a soln. of pregnan-3 $\alpha$ ,11 $\beta$ ,17 $\alpha$ -triol-20-one in acetic acid-acetic anhydride, the temp. maintained at ca. 25°, also during an exothermic reaction occurring after an induction period of 1-2 hrs., and the product isolated after standing overnight  $\rightarrow$  pregnan-3 $\alpha$ ,11 $\beta$ ,17 $\alpha$ -triol-20-one triacetate (Crude Y: 98.4%) refluxed 24 hrs. with Na-carbonate in methanol-water  $\rightarrow$  pregnan-3 $\alpha$ ,11 $\beta$ ,17 $\alpha$ -triol-20-one 11-acetate (Crude Y: 97%). E. P. Oliveto et al., Am. Soc. 75, 5486 (1953).

*Sulfosalicylic acid* ←**Acetylation of alcohols  
with simultaneous formation of  
enolesters from ketones** ←

268.

A mixture of acetic anhydride, toluene, and a little sulfosalicylic acid slowly distilled for ca. 45 min. until all acetic acid has been removed, 17 $\alpha$ -hydroxy-21-acetoxyallopregnane-3,20-dione added, heated 3.5 hrs. with distillation of the resulting acetic acid, of which 1 mole is formed in 10 min., and a second mole in the next 2 hrs.  $\rightarrow$  3,17 $\alpha$ ,21-triacetoxy-2-allopregnen-20-one. Y: 84.4 %. (Am. Soc. 76, 747.)—Sulfosalicylic acid is a stronger catalyst for enol acetylation than toluenesulfonic acid (Am. Soc. 76, 743). F. e. s. H. V. Anderson et al., Am. Soc. 76, 747, 743 (1954).

*Sulfuric acid* $H_2SO_4$ **Alkoxyhalides from halogenhydrins**

ROR

A mixture of ethylene chlorohydrin, concd.  $H_2SO_4$ , and benzene warmed on a water bath, a soln. of benzhydrol in benzene added during 30-50 min. with efficient stirring, and refluxed 4 hrs. with stirring  $\rightarrow$  benzhydryl  $\beta$ -chloroethyl ether. Y: 81-88%. S. Sugawara and K. Fujiwara, Org. Synth. 33, 11 (1953).

 **$\alpha$ -Aminoalcohols from cyanohydrins  
with protection of the hydroxyl group  
by formation of alkoxymethyl ethers** ←

3-Methoxy-2-hydroxypropionitrile, ethylal, and a little  $H_2SO_4$  refluxed 0.5 hr.  $\rightarrow$  3-methoxy-2-ethoxymethoxypropionitrile (Y: 95%) hydrogenated 1 hr. with Raney-Ni in the presence of  $NH_3$  at 108-125° and

450-700 atm.  $\rightarrow$  3-methoxy-2-ethoxymethoxypropylamine (Y: 90%) refluxed 15 min. with ethanol and HCl, then the ethanol-ethylal azeotrope and excess ethanol distilled off  $\rightarrow$  3-methoxy-2-hydroxypropylamine (Y: 88%). R. C. Schreyer, *Am. Soc.* 73, 4404 (1951).

s. 8, 235; s. a. C. K. Bradsher et al., Am. Soc. 74, 4880 (1952); 76, 2357 (1954)

## Ethers from quaternary ammonium salts

Gramine methiodide added to a soln. of Na in methanol, then a  $N_2$ -stream passed through for 24 hrs. whereby trimethylamine is removed  $\rightarrow$  3-methoxymethylindole. Y: 79%. T. A. Geissman and A. Armen, *Am. Soc.* 74, 3916 (1952); with KOH s. A. P. Terent'ev, A. N. Kost, and S. M. Gurvich, *Ж.* 23, 615 (1953).

## Rearrangement of isoxazolidones

2.2 g. 4-anilinomethylene-3-methylisoxazolid-5-one monohydrate in ethanol containing Na warmed 10 min. at  $50^\circ \rightarrow$  1 g. 4-acetyl-2-phenylisoxazolid-5-one. F. e. s. G. Shaw, *Soc.* 1952, 3428.

## Enolethers from nitrocyclopropanes

The solid stereoisomer of 3-phenyl-2-methyl-2-nitro-1-acetylcyclopropane in methanol added dropwise to a soln. of Na in methanol, and the product isolated after 10 min.  $\rightarrow$  5-methoxy-4-phenyl-4-hexene-2-one. Y: 98%.—The keto group is necessary for the reaction. L. I. Smith and J. S. Showell, *J. Org. Chem.* 17, 827 (1952).

Sodium nitrite

$NaNO_2$

## Phenols from amines

$NH_2 \rightarrow OH$

s. 3, 183; s. a. H. Gies and E. Pfeil, *A.* 578, 11 (1952)

## Replacement of imino groups by oxygen

$C:NH \rightarrow CO$

2-Imino-1,4-dimethyl-3,3-diphenylpyrrolidine hydrochloride allowed to react with Na-nitrite and dil. HCl  $\rightarrow$  1,4-dimethyl-3,3-diphenylpyrrolidone. Y: ca. 100%. F. e. s. W. Wilson, *Soc.* 1952, 3524.

## Pyrrole ring opening

C

Satd. aq.  $\text{NaNO}_2$  added portionwise with vigorous stirring at  $80^\circ$  to a mixture of tetraphenylpyrrole and glacial acetic acid, and stirring continued until a yellow soln. results  $\rightarrow$  *cis*-dibenzoylstilbene. Y: 70%. R. Kuhn and H. Kainer, A. 578, 227 (1952).

Sodium nitrite/trifluoroacetic acid

 $\text{NaNO}_2/\text{CF}_3\text{COOH}$ 

## Replacement of amino groups by hydroxyl

 $\text{NH}_2 \rightarrow \text{OH}$ 

6. **Diazonium perhalogenocarboxylates.** Diazonium trifluoroacetates are comparatively stable. In aq. soln. they undergo smoothly and with good yields the usual replacement and coupling reactions.—E: Concd. aq.  $\text{NaNO}_2$  added at  $0-5^\circ$  to aniline in ca. 1.5 N aq. trifluoroacetic acid until a slight excess is present, warmed 75 min. at  $50^\circ$ , then heated 15 min. at  $100^\circ \rightarrow$  phenol. Y: 88%. F. e. and use of other perhalogenocarboxylic acids s. M. R. Pettit, M. Stacey, and J. C. Tatlow, Soc. 1953, 3081.

Sodium nitrite/phosphoric acid

 $\text{NaNO}_2/\text{H}_3\text{PO}_4$ 

**Phenols.** 15 g. *m*-tolidine hydrochloride diazotized at  $5^\circ$  with  $\text{NaNO}_2$  in aq.  $\text{HCl}$ , and the diazonium salt soln. boiled 10 min. with a large amount of dil.  $\text{H}_3\text{PO}_4 \rightarrow$  4,4'-dihydroxy-2,2'-dimethylbiphenyl. Y: 90%. H. Brockmann and A. Dorlars, B. 85, 1168 (1952).

Cupric chloride

 $\text{CuCl}_2$  $\alpha$ -Acoxyketones from  $\alpha$ -diazoketones $\text{COCHN}_2 \rightarrow \text{COCH}_2\text{OAc}$  $\alpha$ -Diazoketones as reagents for the identification of carboxylic acids

The  $\text{CuCl}_2$ -catalyzed decomposition of  $\alpha$ -diazoacetophenones in dioxane in the presence of a carboxylic acid yields phenacyl esters. Y: 60-100%. —E: *p*-Bromo- $\alpha$ -diazoacetophenone and propionic acid  $\rightarrow$  *p*-bromophenacyl propionate. F. e. s. J. L. E. Erickson, J. M. Dechary, and M. R. Kesling, Am. Soc. 73, 5301 (1951).

Barium hydroxide

 $Ba(OH)_2$  **$\alpha$ -Aminocarboxylic acids  
via hydantoins**

s. 9, 832

Zinc

Zn

**Ketones from  $\alpha$ -nitroethylene derivatives** $C:C(NO_2) \rightarrow CHCO$ s. 2, 224; s. a. C. E. Anagnostopoulos and L. F. Fieser, *Am. Soc.* 76, 532 (1954)

Zinc amalgam

Zn, Hg

 **$\alpha$ -Hydroxycarboxylic acids from azlactones  
Reductive oxazolone ring opening**

C

288.

A mixture of 2-methyl-4-benzal-5-oxazolone, amalgamated Zn, and 6 *N* HCl refluxed 8 hrs.  $\rightarrow$  phenyllactic acid. Y: good. E. C. Bubl and J. S. Butts, *Am. Soc.* 73, 4972 (1951).

Zinc chloride

 $ZnCl_2$ **Phenoethers and phenols  
from amines** $\leftarrow$ 

via diazonium chloride-zinc chloride complex

289.

3-Amino-4'-acetobiphenyl diazotized in aq. HCl with concd. aq. Na-nitrite at 0-5°, then  $ZnCl_2$  added with stirring, the resulting diazonium chloride-zinc chloride complex isolated, the crude dry complex added to abs. methanol, and gently heated for 1 hr. until a test with an alkaline soln. of  $\beta$ -naphthol shows that the reaction is complete  $\rightarrow$  3-methoxy-4'-acetobiphenyl. Y: 68%.—Prepn. of phenols via the ethers using the above procedure may be recommended when the desired phenol is quite reactive and not sufficiently volatile with steam. F. e. s. C. K. Bradsher, F. C. Brown, and H. K. Porter, *Am. Soc.* 76, 2357 (1954); method s. H. H. Hodgson and C. K. Foster, *Soc.* 1942, 581.

*Hexamethylenetetramine***Aldehydes from tert. amines**

Powdered hexamethylenetetramine added to a boiling soln. of 2-carbethoxy-3-dimethylaminomethylindole in glacial acetic acid, and refluxed 1 min.  $\rightarrow$  2-carbethoxyindole-3-aldehyde. Y: 68-72%.—Certain phenolic Mannich bases can be converted to aldehydes in the same way, but in poorer yields. Mannich bases derived from ketones evidently do not undergo the reaction. F. e. s. H. R. Snyder, S. Swaminathan, and H. J. Sims, *Am. Soc.* **74**, 5110 (1952).

*Amino acid oxidase/catalase/oxygen* **$\alpha$ -Ketocarboxylic acids****from  $\alpha$ -aminocarboxylic acids**

Catalase and L-amino acid oxidase soln. added successively to an aq. suspension of L-leucine, kept at 37° and pH 7.2 (adjusted by addition of 2 N NaOH) in an  $O_2$ -stream, with occasional addition of caprylic alcohol to control foaming, until the oxidation is complete, then the product isolated as the Na-salt  $\rightarrow$  Na- $\alpha$ -ketoisocaproate. Y: 70-85%. F. e., also from D-amino acids with D-amino acid oxidase, s. A. Meister, *Biochem. Prep.* **3**, 66 (1953).

*Streptococcus faecalis***Ureas from guanidines**

A cell suspension of *Streptococcus faecalis* treated with cetyltrimethylammonium bromide, then added to a soln. of L-arginine monohydrochloride and Na-acetate in dil. acetic acid, incubated at 37° until after ca. 1 hr. all the arginine has disappeared, and the product isolated as the Cu-chelate  $\rightarrow$  Cu-L-citrulline. Y: 90%. V. A. Knivett, *Biochem. Prep.* **3**, 104 (1953).

Trifluoroacetic acid/sodium nitrite

s. 9, 307

**Aminoethers from aminoalcohols**Hal  $\rightarrow$  OR

A soln. of  $\beta$ -methylaminoethanol in benzene added during 1 hr. to a soln. of 1 molar equivalent of  $\alpha$ -bromo- $\alpha, \alpha$ -diphenylacetic acid in the same solvent, and refluxed 8 hrs.  $\rightarrow$   $\alpha$ -( $\beta$ -methylaminoethoxy)- $\alpha, \alpha$ -diphenylacetic acid hydrobromide. Y: 73.5%. H. S. Mosher, M. B. Frankel, and M. Gregory, Am. Soc. 75, 5326 (1953).

### Carboxylic acid esters from carboxylic acid chlorides

s. 2, 277; phenol esters s. J. Colonge and R. Chambard, *Bl.* 1953, 573

### Reactions with fluoro compounds

←

### Carboxylic acid amides from 1,1,1-dihalogenamines

Polyfluoroalkyl-*tert*-amines are highly reactive in contrast to the corresponding ethers, sulfides, and sulfones (*Am. Soc.* 74, 749).—E: N-(2-Chloro-1,1,2-trifluoroethyl)diethylamine stirred with excess water  $\rightarrow$  N,N-diethyl- $\alpha$ -chloro- $\alpha$ -fluoroacetamide. Y: ca. 100%. R. L. Pruett et al., *Am. Soc.* 72, 3646 (1950); reaction with alcohols s. *Am. Soc.* 74, 749 (1952).

### Sodium

Na

### 1,2-Diglycerides

### Blocking of hydroxyl groups by formation of benzyl ethers

### Cleavage of acetals

1,2-Isopropylideneglycerol added portionwise with stirring to powdered Na in toluene, refluxed 1 hr. after the vigorous reaction has subsided, ca. 1 molar equivalent benzyl chloride added to the gently refluxing stirred soln. during 0.5 hr., and heating continued for 1 hr.  $\rightarrow$  3-benzyl-1,2-isopropylideneglycerol (Y: 78%) heated 2 hrs. with 10% acetic acid on a boiling water bath with frequent shaking  $\rightarrow$  1-benzylglycerol (Y: 87%) and pyridine dissolved in  $\text{CCl}_4$ , treated with palmitoyl chloride in  $\text{CCl}_4$ , and kept overnight at  $40^\circ$   $\rightarrow$  3-benzyl-1,2-dipalmitoylglycerol (Y: 88%) dissolved with gentle warming in *n*-hexane, and hydrogenated 2 hrs. with Pd-black until the  $\text{H}_2$ -uptake has ceased  $\rightarrow$  1,2-dipalmitin (Y: 93%). F. e. s. R. J. How and T. Malkin, *Soc.* 1951, 2663.

## O-Acylation

OH → OAc

304.

A soln. of 2,6-dibenzoyl-p-cresol in dry benzene treated during 2 hrs. with small pieces of Na with occasional shaking and gentle heating towards the end of the reaction, separated from excess Na, then treated dropwise with acetyl chloride until decolorized → 2,6-dibenzoyl-p-cresol acetate. Y: 99.7%.—Acetylation in the usual way was unsuccessful. M. S. Newman and A. G. Pinkus, *J. Org. Chem.* **19**, 992 (1954).

Potassium

K

## Carbalkoxyenoethers

←

from  $\beta$ -ketocarboxylic acid esters

s. 6, 243; cf. S. J. Rhoads, R. D. Reynolds, and R. Raulins, *Am. Soc.* **74**, 2889 (1952)

Sodium hydride

NaH

## Ethers from halides

Hal → OR

s. 5, 194; methoxylation s. C. D. Hurd and W. H. Saunders, Jr., *Am. Soc.* **74**, 5324 (1952)

Sodium hydroxide

NaOH

## Replacement of chlorine by hydroxyl

Cl → OH

305.

A suspension of finely powdered NaOH in benzene added to N-( $\beta$ -chloroethyl)-2-pyrrolidone, and refluxed 12 hrs. → N-( $\beta$ -hydroxyethyl)-2-pyrrolidone. Y: 76%. B. Puetzer, L. Katz, and L. Horwitz, *Am. Soc.* **74**, 4959 (1952).

306.

via sulfonic acids. Crude 1,2,4-trichlorobenzene (prepn. s. 973) added with stirring during 10 min. to 25%-oleum, and the product isolated as the Na-salt after several min. more → crude Na-2,4,5-trichlorobenzenesulfonate (Y: 93-95%) heated 2 hrs. with aq. NaOH at 230° and

150-160 lb. pressure  $\rightarrow$  Na-2,5-dichloro-4-phenolsulfonate (Y: 86-87%) gently boiled with 70%  $\text{H}_2\text{SO}_4$  for 2 hrs.  $\rightarrow$  2,5-dichlorophenol (Y: 71-73.5%). A. Galat, Am. Soc. 74, 3890 (1952).

### Halogenethers from dihalides

s. 9, 312

### Acyl peroxides from carboxylic acid chlorides

s. 5, 95; s. a. J. d'Ans, J. Mattner, and W. Busse, Ang. Ch. 65, 57 (1953)

### Oxido compounds and bromohydrins from 1,2-dibromides

p-Methoxystyrene dibromide dissolved in dioxane, an equal volume water added in one portion with stirring, and the product isolated after 2-3 min. when the turbid mixture has become clear  $\rightarrow$  p-methoxystyrene bromohydrin. Y: 87-100%.

aq. NaOH added in one portion with stirring at room temp., and the product isolated after 10-15 min.  $\rightarrow$  p-methoxystyrene oxide. Y: 86.6%.

C. O. Guss, Am. Soc. 74, 2561 (1952); cf. Am. Soc. 75, 3177 (1953).

### Carbonic acid esters

A soln. of commercial  $\text{COCl}_2$  in toluene added at 0-5° portionwise with efficient stirring during 60-75 min. to a soln. of catechol in deaerated aq. NaOH under  $\text{N}_2$ , stirring continued 1 hr. at 0-5°, then allowed to come to room temp.  $\rightarrow$  o-phenylene carbonate. Y: 79-86%. R. S. Hanslick, W. F. Bruce, and A. Mascitti, Org. Synth. 33, 74 (1953).

Potassium hydroxide

KOH

**p-Dioxanes by dimerization**

309.

A soln. of 10 g. 1-chlorocyclohexyl phenyl ketone in anhydrous ether stirred 24 hrs. in the presence of fused KOH  $\rightarrow$  8 g. 1-hydroxycyclohexyl phenyl ketone dimer (startg. m. f. 796). I. Elphimoff-Felkin and B. Tchoubar, *Bl.* 1952, 551.

**Carboxylic acids from  
cyclic  $\alpha$ -halogenoketones  
Ring contraction**

310.

**Benzene ring from tropone ring.** A mixture of 2-chloro-5-phenyltropone and 10% alc. KOH refluxed 10 min. on a steam bath  $\rightarrow$  diphenyl-4-carboxylic acid. Y: 97%. F. e. s. W. von E. Doering and L. H. Knox, *Am. Soc.* 75, 297 (1953).

Potassium hydroxide/alcohol

**Ethers from halides**Hal  $\rightarrow$  OR

311.

A soln. of 4,6-dinitro-3-chlorobenzoic acid in methanol added to a soln. of KOH in abs. methanol, and allowed to stand 12 hrs. at room temp.  $\rightarrow$  4,6-dinitro-3-methoxybenzoic acid. Y: 77%. H. Goldstein and R. Stamm, *Helv.* 35, 1330 (1952);  $\alpha$ -alkoxyacetylene derivatives s. A. N. Pudovik, *Ж.* 21, 1462 (1951); *C. A.* 46, 4467 b.

**Halogenethers from dihalides**

312. 4 moles pentamethylene dibromide, 1 mole guaiacol, and methanolic 2.7 N KOH heated 2 hrs. on a steam bath  $\rightarrow$  5-o-methoxyphenoxy-pentyl bromide (startg. m. f. 888). Y: 76%. F. e. s. A. W. Nineham, *Soc.* 1953, 2601; with aq. NaOH, added slowly, s. P. A. Boivin et al., *Can. J. Chem.* 30, 994 (1952); cf. *Can. J. Chem.* 30, 592.

Sodium/alcohol

NaOR

**Replacement of chlorine by alkoxyl**

2-Chlorobenzothiazole added dropwise during 10 min. at 0° to a soln. of the equivalent amount of Na in abs. ethanol, then refluxed 30 min. → 2-ethoxybenzothiazole (startg. m. f. 20). Y: 93%.—Excess Na-ethoxide lowers the yield. F. e. s. H. Gilman, K. E. Lentz, and J. A. Beel, *Am. Soc.* **74**, 1081 (1952).

**Simultaneous  
O- and C-methylation**

s. 9, 882

**Carboxylic acid esters  
from  $\alpha$ -halogenoketones**

←

A soln. of Na in ethanol added to a soln. of  $\alpha$ -chloro- $\alpha,\alpha$ -diphenylacetone (prepn. s. 626) in abs. ethanol, and the product isolated after a few min. → ethyl  $\beta,\beta$ -diphenylpropionate. Y: 85%. C. L. Stevens and A. E. Sherr, *J. Org. Chem.* **17**, 1228 (1952).

Potassium/alcohol

KOR

**Aromatization of  
 $\alpha$ -aminomethyleneketones**

←

0.75 g. 1,2,3,4,5,6-hexahydro-3-keto-10-methoxy-4-N-methylanilinomethylenechrysene in tetrahydrofuran added to a soln. of K in *tert*-butanol under  $\text{N}_2$ , refluxed 5 min., and methyl iodide added to the boiling soln. to discharge the brown color → 0.52 g. 1,2-dihydro-3,10-dimethoxy-4-N-methylanilinomethylchrysene. A. J. Birch. J. A. K. Quartey, and H. Smith, *Soc.* **1952**, 1768.

Sodium carbonate

 $\text{Na}_2\text{CO}_3$ **Replacement of bromine by hydroxyl** $\text{Br} \rightarrow \text{OH}$

Potassium hydrogen carbonate

**Replacement of halogen by acoxy groups**

s. 9, 642

Sodium formate

**Replacement of halogen by hydroxyl**

replacement of bromine s. 6, 249; of chlorine s. C. D. Hurd and K. L. Kreuz, Am. Soc. 74, 2965 (1952)

Potassium acetate

**Replacement of bromine by acoxy groups  
in silanes, also cleavage**

316.

 $\alpha$ -BromobenzyltrimethylsilaneDiphenyl- $\alpha$ -bromomethyltri-  
methylsilane

refluxed with K-acetate in glacial acetic acid

for 18-24 hrs., then allowed to  
stand 24-36 hrs. longer  $\rightarrow$   $\alpha$ -tri-  
methylsilylbenzyl acetate. Y:  
84%.for 7.5 hrs.  $\rightarrow$  benzhydryl ace-  
tate. Y: 79%.

F. e. s. C. R. Hauser and C. R. Hance, Am. Soc. 74, 5091 (1952).

Potassium oxalate

**Aldehydes from 1,1-dibromides**

s. 7, 292; s. a. J. C. Bill and D. S. Tarbell, Org. Synth. 34, 82 (1954)

Sodium salt

**Arylethers**

s. 9, 953

**Carboxylic acid anhydrides  
from carboxylic acid chlorides**1 molar equivalent of phenylacetic chloride added dropwise to a  
stirred suspension of 1 molar equivalent of Na-phenylacetate in ben-

zene, and stirring continued for 3 hrs.  $\rightarrow$  phenylacetic anhydride. Y: 87%. F. e. s. J. A. King and F. H. McMillan, *Am. Soc.* 73, 4911 (1951).

### Pyridine

### Glycerides

### Cleavage of acetals

Chaulmoogroyl chloride added with shaking to isopropylideneglycerol and dry pyridine in benzene, and allowed to stand overnight  $\rightarrow$  isopropylideneglycerol chaulmoograte (Y: 83%) in ether cooled in an ice-bath, treated slowly with ice-cold concd. HCl with vigorous shaking and kept 0.5 hr. in the ice-bath with frequent shaking  $\rightarrow$  1-monochaulmoogrin (Y: 90%). F. e., also di- and tri-glycerides, s. A. Gupta and T. Malkin, *Soc.* 1952, 2405.

### 1,2-Diglycerides

s. 9, 303

### Selective acylation

Benzoyl chloride added at  $-10^\circ$  to ethyl 3 $\beta$ ,5,19-trihydroxyetiocholanate in pyridine, and kept overnight at room temp.  $\rightarrow$  ethyl 3 $\beta$ ,19-dibenzoxo-5-hydroxyetiocholanate. Y: 86%. P. T. Herzig and M. Ehrenstein, *J. Org. Chem.* 17, 713 (1952).

### O-Carbethoxylation

0. cf. *Synth. Meth.* 7, 301

Equatorial hydroxyl groups at C<sub>6</sub>, C<sub>7</sub>, C<sub>12</sub>, and C<sub>17</sub> of steroids are invariably carbethoxylated while polar hydroxyl groups are not. Activation by a double bond overcomes hindrance effects. Carbethoxylation also in dioxane in the presence of pyridine s. L. F. Fieser et al., *Am. Soc.* 74, 3309 (1952).

**Carboxylic acid anhydrides  
from carboxylic acid chlorides  
and carboxylic acids**

n-Heptanoyl chloride added at  $-10^\circ$  to an ethereal soln. of n-heptanoic acid and pyridine  $\rightarrow$  n-heptanoic anhydride. Y: 97%. W. Gerrard and A. M. Thrush, Soc. 1953, 2117.

**Urethans from phenols**

s. 3, 216; s. a. H. Gilman et al., J. Org. Chem. 19, 1067 (1954)

**Copper**

**Diaryl ethers**

**Ullmann reaction**

s. 2, 255; 4, 240; s. a. W. M. Whaley, L. Starker, and M. Meadow, J. Org. Chem. 18, 833 (1953)

**Cupric oxide**

**Ethers from halides**

322.

2-Iodothiophene and pulverized CuO added to a soln. of Na in abs. methanol, and gently refluxed 30 hrs. with stirring  $\rightarrow$  2-methoxythiophene. Y: 80%.—Cupric oxide is more satisfactory than cuprous oxide or copper. J. Sicé, Am. Soc. 75, 3697 (1953).

**Silver oxide**

**Methylation of carbohydrates**

s. 2, 257/8; s. a. P. J. Stoffyn and R. W. Jeanloz, Am. Soc. 74, 563 (1954)

**Silver carbonate**

**Replacement of bromine by hydroxyl**

**Carbohydrates**

s. 3, 218; s. a. H. G. Fletcher, Jr., Am. Soc. 75, 2624 (1953)

**Silver nitrate**

**Nitric acid esters from halides**

323.

The use of Ag-nitrate in acetonitrile is a very convenient method for preparing laboratory quantities of pure nitrates. The reaction may be followed by weighing the Ag-halide precipitate.—E: A soln. of ethyl  $\beta$ -bromopropionate in acetonitrile added to a soln. of Ag-nitrate in acetonitrile, and allowed to stand 3 days at room temp.  $\rightarrow$  ethyl hydrazylate nitrate. Y: 58%. F. e. s. A. F. Ferris et al., Am. Soc. 75, 4078 (1953).

Silver salt

Ag<sup>+</sup>**Carboxylic acid esters**

COOR

4.

A threefold excess of methyl iodide added dropwise to crude Ag-o-acetobenzoate (prepared from a soln. of o-acetobenzoic acid in 2 N NaOH and AgNO<sub>3</sub>), and worked up after cooling to room temp. → methyl o-acetobenzoate. Y: 88%.—By this procedure, formation of the pseudo-ester is avoided. J. H. Boyer and D. Straw, Am. Soc. 75, 2683 (1953).

**Sulfonic acid esters**

←

5.

A soln. of Ag-p-toluenesulfonate and methylene iodide in *acetonitrile* refluxed 24 hrs. → methylene bis-tosylate. Y: 87%. F. e. s. W. D. Emmons and A. F. Ferris, Am. Soc. 75, 2257 (1953).

Calcium chloride

CaCl<sub>2</sub>**Acetals from 1,1-acoxyhalides**C(OAc)Hal → C(OR)<sub>2</sub>

s. 9, 600

Magnesium oxide

MgO

COCl → COOH

s. 9, 402

Mercuric acetate

(CH<sub>3</sub>COO)<sub>2</sub>Hg**Carboxylic acids from cyclic α-halogenoketones  
Ring contraction**

←

26.

Mercuric acetate and 1-bromobicyclo[3.3.1]nonan-9-one added to dry *tert*-butanol, refluxed 6 hrs., filtered from traces of a solid, and poured into water → bicyclo[3.3.0]octane-1-carboxylic acid. Y: 74%. A. C. Cope and E. S. Graham, Am. Soc. 73, 4702 (1951).

Aluminum halides

AlHal<sub>3</sub>**Acylation of unreactive alcohols**

OH → OAc

s. 8, 286; s. a. Am. Soc. 76, 2329 (1954)

## Formamide

## Reaction of halides with formamide

## Hydrolysis of halides

 $\alpha$ -Hydroxy- from  $\alpha$ -halogeno-carboxylic acid esters

## Carboxylic acids from 1,1,1-trihalides

Ethyl  $\alpha$ -bromobutyrate allowed to react with formamide and the theoretical amount of water at 150° for 5 hrs. with vigorous stirring  $\rightarrow$  ethyl  $\alpha$ -hydroxybutyrate. Y: 91%.—Similarly at 100°: Benzotrichloride  $\rightarrow$  benzoic acid. Y: 80%.—Also formoxy compounds and carboxylic acid amides in the absence of water s. H. Bredereck, R. Gompper, and G. Theilig, B. 87, 537 (1954).

## Sulfuric acid

## Partial replacement of halogen by hydroxyl

A mixture of 2,6,8-trichloroquinoline and  $H_2SO_4$ -water heated 3.5 hrs. in an oil bath at 170–210°  $\rightarrow$  6,8-dichloro-2-hydroxyquinoline. Y: almost 100%. F. e. s. C. R. Saunders, C. E. Smith, Jr., and J. D. Capps, Am. Soc. 73, 5910 (1951).

## Selective formation of carboxylic acids from 1,1,1-trichlorides

1,1,1-Trichloro-4,4,4-trifluoro-2-butene (prepn. s. 132) heated with concd.  $H_2SO_4 \rightarrow \gamma,\gamma,\gamma$ -trifluorocrotonic acid. Y: 68%. R. N. Haszeldine, Soc. 1953, 922.

## Hydrochloric acid

## Aminoalcohols from acylaminohalides

N-(2-Chloro-1-phenylethyl)acetamide heated 24 hrs. with concd. HCl on a steam bath  $\rightarrow \beta$ -hydroxy- $\alpha$ -phenylethylamine hydrochloride. Y: 90%. F. e. s. T. L. Cairns et al., J. Org. Chem. 17, 751 (1952).

## Degradation of carbohydrates

346.

A soln. of Pb-tetraacetate in glacial acetic acid added with cooling at  $20^\circ$  to a soln. of 2,6-dimethyl-D-glucose in glacial acetic acid, kept 10 min. at room temp., and the resulting 4-formyl-2,5-dimethyl-D-arabinose deformylated by heating in aq. 0.5 N HCl on a steam bath for 45 min.  $\rightarrow$  2,5-dimethyl-D-arabinose. Y: ca. 100%. J. Fried and D. E. Walz, Am. Soc. 74, 5468 (1952); s. a. A. S. Perlin, Am. Soc. 76, 2595 (1954).

**Oxidative cleavage of  $\alpha$ -hydroxyketones  
and  $\alpha$ -ketocarboxylic acids  
 $\alpha$ -Diketones from  $\alpha$ -hydroxyketones**

Pb-tetraacetate effects quantitative oxidative cleavage of  $\alpha$ -hydroxyketones and  $\alpha$ -ketocarboxylic acids, in the presence of substances forming pseudoglycols by addition (e.g. water, alcohols, HCN). In their absence, no reaction takes place between Pb-tetraacetate and  $\alpha$ -ketocarboxylic acids, whereas  $\alpha$ -hydroxyketones are oxidized without cleavage to the respective  $\alpha$ -diketones in good yield. Esters in place

of the acids are obtained as degradation products in the presence of alcohols.—E: A soln. of Pb-tetraacetate in benzene added to a soln. of phenylglyoxylic acid in dry benzene-ethanol, and kept 1 hr. at 45° → ethyl benzoate. Y: 80%.—Finely powdered Pb-tetraacetate added to a soln. of anisoin in 90% -acetic acid, kept 20 min. at 50-55° with frequent shaking, then  $\text{Pb}^{++}$  precipitated as Pb-sulfate by addition of the calculated amount of concd.  $\text{H}_2\text{SO}_4$  → anisic acid (Y: 76.8%) and anisaldehyde (Y: 83% as the p-nitrophenylhydrazone).—Finely powdered Pb-tetraacetate added to a soln. of benzoin in glacial acetic acid, and kept 24 hrs. at 50° with occasional shaking → benzil. Y: 83.4%. F. e. s. E. Baer, Am. Soc. 62, 1597 (1940); cleavage of  $\alpha$ -hydroxyketones s. a. D. Y. Curtin and S. Leskowitz, Am. Soc. 73, 2633 (1951); cleavage of  $\alpha$ -ketocarboxylic acids s. a. W. Voser et al., Helv. 35, 2414 (1952).

Azo compounds by coupling  
with simultaneous replacement  
of nitro by thiocyanato groups

s. 9, 681

Sodium acetate

 $\text{CH}_3\text{COONa}$ Reaction of active methyl groups  
with diazonium salts

←

423.

Azo coupling is a useful method for determination of activity of H-atoms in methyl groups. Such activity is present in compounds con-

taining directly attached heterocyclic residues or ar. rings with electrophilic groups in o- and p-positions. Nucleophilic groups conjugated with the methyl group strongly reduce the activity of H-atoms in the latter. Transition of the hetero atom into the onium state enhances its electrophilic properties and increases the mobility of H-atoms in methyl groups conjugated with the hetero atom.—E: A soln. of benzenediazonium chloride (prepared from aniline with  $\text{NaNO}_2$  in  $\text{HCl}$  at  $0^\circ$ ) added in 2 portions over a period of 28 hrs. to a soln. of 2-acetamido-9-methylacridine and Na-acetate in acetic acid, and the product isolated after 24 hrs.  $\rightarrow$  2-acetamido-9-acridylaldehyde phenylhydrazone. Y: 65.9%. F. e. s. A. A. Kharkharov, *Ж.* 23, 1175 (1953); C. A. 47, 12390c.

**Carboxylic acid amides**  
**from carboxylic acid esters**

s. 7, 425; 8, 436; in toluene-1,2,4-trichlorobenzene s. J. Weijlard, G. Purdue, and M. Tishler, *Am. Soc.* 76, 2505 (1954)

**(Diacylamino)carboxylic acids  
from acylaminocarboxylic acids  
Protection of carboxyl groups  
by formation of benzyl esters**

A mixture of aceturic acid, benzyl alcohol, concd.  $\text{H}_2\text{SO}_4$ , and toluene refluxed 48 hrs. in a Soxhlet extraction apparatus containing anhydrous BaO in the thimble, the BaO being replaced by fresh oxide after 16 hrs.  $\rightarrow$  benzyl aceturate (Y: 91.0%) dissolved in acetic anhydride and refluxed 5 hrs.  $\rightarrow$  N,N-diacetyl-glycine benzyl ester (Y: 91%) hydrogenated 3 hrs. with Pd-on-Darco in dry dioxane  $\rightarrow$  crude N,N-diacetyl-glycine (Y: 97.2%). F. e. s. J. C. Sheehan and E. J. Corey, Am. Soc. 74, 4555 (1952).

**Dicarboxylic acid imides**  
**from dicarboxylic acids**

s. 8, 439; with  $\text{NH}_3$  s. C. A. Miller and L. M. Long, Am. Soc. 75, 6256 (1953); H. L. Lochte and E. N. Wheeler, Am. Soc. 76, 5548 (1954)

**Dicarboxylic acid imides**  
**from dicarboxylic acid esters**

Diethyl methyliminodiacetate methochloride added to a satd. anhydrous alc.  $\text{NH}_3$  soln.  $\rightarrow$  methyliminodiacetic acid imide methohydroxide. Y: 80-85%. M. Viscontini, J. Bally, and J. Meier, Helv. 35, 451 (1952).

**Dicarboxylic acid imides**  
**from dicarboxylic acid anhydrides**

s. 5, 341; s. a. L. M. Rice, E. E. Reid, and C. H. Grogan, J. Org. Chem. 19, 884 (1954)

**Carboxylic acid hydrazides**  
**from carboxylic acid esters**

s. 7, 426; 8, 515; 9, 476; with 85%-hydrazine hydrate s. a. H. L. Yale et al., Am. Soc. 75, 1933 (1953); steroid derivatives, also with anhydrous hydrazine, s. L. F. Fieser and Wei-Yuan Huang, Am. Soc. 75, 6306 (1953)

436.

also with simultaneous hydantoin ring opening

2 moles hydrazine hydrate added to a soln. of ethyl 5-benzylhydantoin-3-acetate in warm abs. ethanol, and the precipitate, initially consisting of a mixture of the product with startg. m., redissolved several times by warming  $\rightarrow$  5-benzylhydantoin-3-acetic acid hydrazide. Y: 80%.

Ethyl 5-benzylhydantoin-3-acetate or 5-benzylhydantoin-3-acetic acid hydrazide heated 3 hrs. with 5 moles hydrazine hydrate in abs. ethanol  $\rightarrow$  carbonyl (glycine hydrazide) (DL-phenylalanine hydrazide). Y: 89%.

F. e. s. K. Schlögl, F. Wessely, and G. Korger, M. 83, 493 (1952).

### Diacylhydrazines

AcNHNHAc

2 moles of propionic anhydride added slowly with cooling to 1 mole 85%-hydrazine hydrate soln., then heated slowly, and refluxed 1 hr.  $\rightarrow$  dipropionylhydrazine. Y: 80%. F. e. s. Du-Yung Wu and R. M. Herbst, J. Org. Chem. 17, 1216 (1952).

### N,N'-Dicarbamylformamidines

RNHCON:CH·NHCONHR

A mixture of cyclohexylurea and excess ethyl orthoformate refluxed 12 hrs.  $\rightarrow$  N,N'-bis(cyclohexylcarbamyl)formamidine. Y: 82.3%. F. e. s. C. W. Whitehead, Am. Soc. 75, 671 (1953).

### Acylguanidines

439.

A soln. of guanidine hydrochloride in abs. alcohol treated with the calculated amount of a soln. of Na in alcohol, the resulting NaCl removed by centrifugation, then the soln. treated with N-dimethylglycine ethyl ester, and refluxed 5 min.  $\rightarrow$  (N,N-dimethylglycyl)guanidine. Y: 65-70%. M. Viscontini, J. Bally, and J. Meier, Helv. 35, 451 (1952).

## Replacement of cyclic oxygen by cyclic nitrogen

### 2-Pyridones from 2-pyrones

s. 3, 302; limitations s. R. H. Wiley, P. Beasley, and L. H. Knabeschuh, *Am. Soc.* **76**, 311 (1954); s. a. **76**, 625

### Enaminolactams from ketocarboxylic acids

440.

The ketoacid derived from cholestenone and benzylamine heated 1 hr. at 180° under N<sub>2</sub> → 4-benzyl-4-azacholestenone-3. Y: 99%. F. e. s. R. B. Woodward et al., *Am. Soc.* **74**, 4223 (1952).

### Reactions with azeotropic water separation (1,3-Di-N)-heterocyclics

s. 6, 405; s. a. H. Zahn, H. Wilhelm, and A. Räuchle, *A.* **579**, 14 (1953)

### 3,5-Piperazinediones

441.

A mixture of methyliminodiacetic acid and urea heated to ca. 160° until frothing starts, and the temp. raised to 170° during 1 hr. after the gas evolution has subsided → 1-methyl-3,5-piperazinedione. Y: 87%. Also labeled compounds s. B. H. Chase and A. M. Downes, *Soc.* **1953**, 3874.

### 1-Hydroxy-2-pyrazinones from hydroxamic acids

442.

A mixture of benzil, L-leucinehydroxamic acid, and 50°-ethanol refluxed 17 hrs. → 1-hydroxy-2-keto-3-isobutyl-5,6-diphenyl-1,2-dihydropyrazine. Y: 67%. F. e. s. S. R. Safir and J. H. Williams, *J. Org. Chem.* **17**, 1298 (1952).

**Pyridine ring from furan ring**  
**3-Hydroxypyridines**  
**Ring expansion**

443.

2-n-Butyrylfuran heated 20 hrs. at 165° with 2-3 moles alc.  $\text{NH}_3$  in a sealed tube  $\rightarrow$  3-hydroxy-2-n-propylpyridine. Y: 74%. F. e. s. W. Gruber, Can. J. Chem. 31, 564 (1953); f. intermediate formulas s. Synth. Meth. 8, 469.

**Pyrazoles from O-heterocyclics**  
**Amines from hydrazones**

444.

A soln. of  $\gamma$ -pyrone in methanol added dropwise with stirring and cooling at ca. 25° to a soln. of hydrazine hydrate in methanol, when the exothermic reaction is over heated a few min. on a steam bath, cooled, liq.  $\text{NH}_3$  added cautiously with stirring, and hydrogenated 1-2 hrs. with Raney-Ni at 90° and 1500 lb. pressure  $\rightarrow$  3- $\beta$ -aminoethylpyrazole. Y: 81%. F. e. s. R. G. Jones et al., Am. Soc. 75, 4048 (1953); 76, 3172 (1954).

**Oxazolidines**  
**from oxido compounds**

445.

Aq. 29%- $\text{NH}_3$  added with stirring to a soln. of benzaldehyde in ethanol, then epichlorohydrin added in a thin stream with stirring, whereby the temp. rises to 40-45° over a period of 2 hrs., then allowed to stand overnight at room temp., finally heated 20 min. on a steam bath  $\rightarrow$  2-phenyl-5-chloromethyloxazolidine. Y: 69%. H. E. Carter and P. K. Bhattacharyya, Am. Soc. 75, 2503 (1953).

Potassium hydroxide

KOH

**1,2-Dihydro-3,1-benzoxazines**

○

46.

A trace of KOH added to a soln. of o-aminobenzyl alcohol and anisaldehyde in alcohol, and warmed whereby the product precipitates → 1,2-dihydro-2-(p-methoxyphenyl)-3,1,4a-benzoxazine. Y: ca. 100%. B. Witkop, J. P. Patrick, and H. M. Kissman, B. 85, 949 (1952).

Sodium/alcohol

NaOR'

**Hydroxamic acids from carboxylic acid esters**

COOR → CONHOH

s. 8, 455; s. a. J. Org. Chem. 19, 1140 (1954)

**3,5-Pyrazolidiones from malonic acid esters**

○

s. 7, 439; s. a. J. Büchi et al., Helv. 36, 75 (1953); method s. M. Conrad and A. Zart, B. 39, 2282 (1906)

**5-Carbethoxyuracils**

447.

Phenylurea and diethyl ethoxymethylenemalonate added to a soln. of Na in abs. ethanol, and allowed to stand 3 days at room temp. → 3-phenyl-5-carbethoxyuracil. Y: 88%. F. c. s. C. W. Whitehead, Am. Soc. 74, 4267 (1952).

**5-Amino- via 5-nitroso-pyrimidines**

448.

Acetamidine hydrochloride condensed with ethyl hydroxyiminocyanoacetate by using a soln. of Na in ethanol, the resulting Na-salt of 4-

amino-6-hydroxy-2-methyl-5-nitrosopyrimidine (Y: 79%) dissolved in water, warmed to 70°, wet Raney-Ni added portionwise until no further color change occurs, finally heated 1 hr. on a steam bath → 4,5-diamino-6-hydroxy-2-methylpyrimidine (Y: 72%). F. e. s. P. D. Landauer and H. N. Rydon, Soc. 1953, 3721.

*Sodium carbonate*

$\text{Na}_2\text{CO}_3$

**Oximes from ketones**

$\text{CO} \rightarrow \text{C:NOH}$

s. 9, 36

*Potassium carbonate*

$\text{K}_2\text{CO}_3$

**Enamines from aldehydes**

$\text{CHCHO} \rightarrow \text{C:CH(N<)}$

s. 2, 380; s. a. R. Grewe et al., A. 581, 85 (1953)

*Sodium acetate*

$\text{CH}_3\text{COONa}$

**Thiosemicarbazones**

$\text{CO} \rightarrow \text{C:N} \cdot \text{NHCSNH}_2$

s. 9, 432

**1,2,4-Triazoles from hydrazines**  
**Einhorn-Brunner ring closure**

449.

Phenylhydrazine hydrochloride, N-acetylbenzamide, glacial acetic acid, and anhydrous Na- acetate refluxed 10 hrs. → 3-methyl-1,5-diphenyl-1,2,4-triazole. Y: 78%. F. e. s. M. R. Atkinson and J. B. Polya, Soc. 1952, 3418.

*Sodium hydrogen sulfite*

$\text{NaHSO}_3$

**N-Acylation with peroxycarboxylic acids**

$\text{NH} \rightarrow \text{NAC}$

450.

Aq. peracetic acid reduced with 10% excess aq.  $\text{NaHSO}_3$ -soln., cooled in an ice-bath, excess aniline added with swirling, and allowed to stand 1 hr. at room temp. → acetanilide. Y: 86%. F. e. and limitations s. A. H. Soloway and S. L. Friess, Am. Soc. 73, 5000 (1951).

**Potassium iodide**

KI

**Sec. from prim. amines and hydroxy compounds** $\text{NH}_2 \rightarrow \text{NHR}$ 

451.

A mixture of 3-hydroxythieno(3,2-b)pyridine, diethylaminoethylamine, and a little KI heated 72 hrs. at 170-180° in a sealed tube  $\rightarrow$  3-(diethylaminoethylamino)thieno(3,2-b)pyridine. Y: 58.5%. F e. s. J. T. Sheehan, Am. Soc. 74, 5504 (1952).

**Trialkylamine** $R_3N$ **Carboxylic acid amides from carboxylic acids via mixed alkoxyformic acid anhydrides** $\text{CONH}_2$ 

peptides s. 7, 447; s. a. B. F. Erlanger, H. Sachs, and E. Brand, Am. Soc. 76, 1806 (1954); penicillin derivatives s. R. L. Barnden et al., Soc. 1953, 3733

**Triethylamine** $(\text{C}_2\text{H}_5)_3\text{N}$ 

452.

**Dicarboxylic acid amide esters.** Ethyl chloroformate added rapidly with continuous agitation to an ice-salt cooled soln. of ethyl hydrogen bicyclo[2.2.2]octane-1,4-dicarboxylate and triethylamine in chloroform. after 15 min. anhydrous  $\text{NH}_3$  passed through for 5 min., removed from the cooling bath, stirred 1 hr. at room temp., and allowed to stand overnight  $\rightarrow$  ethyl 4-carboxamidobicyclo[2.2.2]octane-1-carboxylate. Y: 87%. J. D. Roberts, W. T. Moreland, Jr., and W. Frazer. Am. Soc. 75, 637 (1953).

**Peptides and carboxylic acid esters via mixed carboxylic acid anhydrides**

453.

**Peptides and carboxylic acid esters.** A soln. of carbobenzoxyglycine and triethylamine in dry toluene cooled to 0° and isovaleryl chloride

added, then ethyl DL-phenylalaninate added to the resulting carbobenzoxyglycyl-isovaleric acid anhydride soln. and kept overnight at 8° → ethylcarbobenzoxyglycyl-DL-phenylalaninate. Y: 86%.—Anhydrides with isovaleric acid have been found particularly advantageous. F. e. s. J. R. Vaughan and R. L. Osato, *Am. Soc.* **73**, 5553 (1951); carboxylic acid esters s. E. D. Nicolaides, R. D. Westland, and E. L. Wittle, *Am. Soc.* **76**, 2887 (1954).

**Carboxylic acid acylthioethylamides  
from carboxylic acids  
via mixed alkoxyformic acid anhydrides  
and carboxylic acid ethylenimides**

Ethyl chloroformate in ethyl acetate added dropwise at -5° to a soln. of triethylammonium pantothenate (prepared from (+)-Ca-pantothenate and triethylamine in water) in dimethylformamide, after 10 min. dropped rapidly with stirring into a soln. of ethylenimine and triethylamine in ethyl acetate, after 20 min. poured into a soln. of thiobenzoic acid in ethyl acetate, and the product isolated after 30 min. at 0° → (+)-S-benzoylpantetheine. Y: ca. 50%. F. e. s. R. Schwyzer, *Helv.* **35**, 1903 (1952).

**Piperidine**

$\text{C}_5\text{H}_{11}\text{N}$

**Pyrimidines from amidines**

Suberodiamidine dihydrochloride, acetylacetone, and piperidine in pyridine refluxed 3 hrs. → hexamethylenebis-2-(4,6-dimethylpyrimidine). Y: 70%. F. e. s. D. D. Libman, D. L. Pain, and R. Slack, *Soc.* **1952**, 2305.

Pyridine/phosphorus trichloride

s. Phosphorus trichloride/pyridine

Silver acetate

**N-Acetylation**

s. 9, 876

Magnesium oxide

**Carboxylic acid amides****from carboxylic acid chlorides**

s. 5, 341; s. a. R. E. Bowman and J. F. Cavalla, Soc. 1954, 1171

Alkylmagnesium iodide

**Carboxylic acid amides****from carboxylic acid esters****Bodroux reaction**

2 moles aniline in dry ether added slowly to 2 moles methyl-MgI in ether, after the vigorous reaction has subsided, methyl hexanoate in ether added, and refluxed 2 hrs. on a water bath  $\rightarrow$  hexanoanilide. Y: 87%. F. e. s. H. L. Bassett and C. R. Thomas, Soc. 1954, 1188.

Magnesium chloride

**Tert. amines from oxo compounds****Extension of the Leuckart synthesis**

A mixture of propiophenone, dimethylformamide, Mg-chloride hexahydrate, and 85%-formic acid heated with distillation of the volatile constituents until the pot temp. reaches approximately the boiling point of the formamide, then refluxed 8 hrs. with stirring  $\rightarrow$  N,N-dimethyl- $\alpha$ -ethylbenzylamine. Conversion: 30%. Y: 79%. F. e., also with  $\alpha, \beta$ -unsatd. carbonyl compounds, s. C. F. Bunnett, J. L. Marks, and H. Moe, Am. Soc. 75, 985 (1953).

Zinc chloride/ammonium chloride

**Imidazolines from nitriles and aminoalcohols**

$NH_4Cl$  suspended in a soln. of  $ZnCl_2$  in benzyl cyanide, then monoethanolamine added dropwise with stirring during 30 min. at 210-220°.

and heating continued for 1.5 hrs. at the same temp.  $\rightarrow$  2-benzyl-imidazoline. Y: 66%. F.e., with lower yields, s. G. Kubiczek and L. Neugebauer, M. 80, 815 (1949).

#### Aluminum

Al

#### Amines from oxo compounds

CO  $\rightarrow$  CHNHR

459.

Aq. 30%-methylamine added to a soln. of pinacolone in alcohol, and this mixture added during 1 hr. with stirring and cooling to a suspension of Al (activated with Hg and  $\text{HgCl}_2$ ) in 50%-alcohol  $\rightarrow$  2-methyl-amino-3,3-dimethylbutane. Y: 75-80%.—This method is convenient for laboratory preparations. F. e. s. H. Albers and S. Lange, B. 85, 278 (1952); method s. Knoll A. G. and W. Klavehn, D. R. P. 617 536.

#### Aluminum oxide

 $\text{Al}_2\text{O}_3$ 

#### Replacement of cyclic oxygen by cyclic nitrogen

CO  $\rightarrow$  CN-

s. 1, 328; N-subst. piperidines s. A. N. Bourns, H. W. Embleton, and M. K. Hansuld, Org. Synth. 34, 79 (1954)

#### Acetic anhydride

 $(\text{CH}_3\text{CO})_2\text{O}$ 

#### Formylation of amines

 $\text{NH}_2 \rightarrow \text{NHCHO}$ 

s. 2, 391; s. a. J. Bornstein, W. J. Reid, and D. J. Torres, Am. Soc. 76, 2760 (1954)

#### Formic acid

 $\text{HCOOH}$ 

#### Sym. ureas from alcohols and urea

 $(\text{RNH})_2\text{CO}$ 

460.

A soln. of 0.2 g. di-(p-methoxyphenyl)methanol in formic acid added to 0.06 g. urea in formic acid, and worked up after 20 min.  $\rightarrow$  0.2 g. bis-[di-(p-methoxyphenyl)methyl]urea. M. P. Balfe, J. Kenyon, and E. M. Thain, Soc. 1952, 790.

Acetic acid

 $\text{CH}_3\text{COOH}$ **Hydrazones** $\text{C:O} \rightarrow \text{C:NNH}\cdot$ 

s. 2, 396/7; separation of ketosteroids by benzilic acid hydrazide s. L. Velluz et al., *Bl.* 1953, 409

**Phthalimides from amines**

s. 1, 331/2; s. a. C. M. Atkinson et al., *Soc.* 1954, 2023

**Pyrroles from 2,5-dialkoxytetrahydrofurans**

461.

A soln. of 2,5-dimethoxy-3-isopropyltetrahydrofuran and aniline in acetic acid refluxed 1.5 hrs.  $\rightarrow$  crude 1-phenyl-3-isopropylpyrrole. Y: 83%. F. e. s. N. Elming and N. Clauson-Kaas, *Acta Chem. Scand.* 6, 867 (1952).

**Isoimidazoles**

462.

A mixture of dibenzyl ketone, benzil,  $\text{NH}_4$ -acetate, and acetic acid refluxed 1 hr.  $\rightarrow$  2,2-dibenzyl-4,5-diphenylisoimidazole hydrate (startg. m. f. 420). Y: 80%. M. Weiss, *Am. Soc.* 74, 5193 (1952).

Nitrobenzene

 $\text{C}_6\text{H}_5\text{NO}_2$ **N-Subst. 4-aminoquinolines from 4-keto-1,2,3,4-tetrahydroquinolines**

463.

A mixture of 4-diethylamino-1-methylbutylamine, 4-keto-7-chloro-1,2,3,4-tetrahydroquinoline, and nitrobenzene heated 5 hrs. in an oil bath at 155-160° under  $\text{N}_2$   $\rightarrow$  crude chloroquine. Y: 92%. F. e., also in phenol-nitrobenzene. s. W. S. Johnson and B. G. Buell, *Am. Soc.* 74, 4513 (1952).

*Hydrazoic acid* $\text{HN}_3$ **Nitriles from aldehydes** $\text{CHO} \rightarrow \text{CN}$ 

s. 4, 380; s. a. W. E. McEwen, W. E. Conrad, and C. A. VanderWerf, Am. Soc. 74, 1168 (1952)

*Phosphorus pentoxide* $\text{P}_2\text{O}_5$ **Aminodesoxybenzoins from benzoins**

←

**Voigt reaction**

s. 4, 382; with heterocyclic sec. amines s. R. V. Heinzelmann and B. D. Aspergren, Am. Soc. 75, 3409 (1953)

*Tetraethyl pyrophosphite* $(\text{C}_2\text{H}_5\text{O})_2\text{POP}(\text{OC}_2\text{H}_5)_2$ **Subst. carboxylic acid amides from carboxylic acids** $\text{COOH} \rightarrow \text{CONH}$ **Peptide synthesis**

464.

Carbobenzoxylglycine and ethyl DL-phenylalaninate added to diethyl phosphite, then tetraethyl pyrophosphite added, and heated 15 min. on a steam bath  $\rightarrow$  ethyl carbobenzoxylglycyl-DL-phenylalaninate. Y: 94%.—No racemization of optically active compounds has been observed when one of the reactants is an acylamino acid. F. e. s. G. W. Anderson, J. Blodinger, and A. D. Welcher, Am. Soc. 74, 5309 (1952); carboxylic acid anilides s. Am. Soc. 74, 5514; oxytocin synthesis s. V. du Vigneaud, Am. Soc. 76, 3115 (1954).

*Dialkyl chlorophosphate* $(\text{RO})_2\text{POCl}$ **Alkylation of amines** $\text{NH} \rightarrow \text{NR}$ 

465.

Diphenylamine and diethyl chlorophosphate heated to 140-155° when a vigorous reaction occurs, and the product isolated after 45 min. at 155-165°  $\rightarrow$  di(phenyl)ethylamine. Y: 82.7%. F. e. s. B. P. Lugovkin and B. A. Arbuzov, Ж. 22, 2041 (1952); C. A. 47, 9283h.

*Phosphoric acid* $\text{H}_3\text{PO}_4$ **2,4-Dinitrophenylhydrazones** $\text{CO} \rightarrow \text{C:N-NHR}$ 

466.

A  $\text{H}_3\text{PO}_4$ -ethanol soln. of 2,4-dinitrophenylhydrazine as reagent has been found to be indefinitely stable and avoids the use of the more reactive  $\text{H}_2\text{SO}_4$ . E. s. G. D. Johnson, Am. Soc. 73, 5888 (1951).

**Subst. carboxylic acid hydrazides  
from carboxylic acid esters**

Ethyl acetate, phenylhydrazine, and aq.  $\text{H}_3\text{PO}_4$  gently refluxed for 1 hr.  $\rightarrow \beta$ -acetylphenylhydrazine. Y: 60%.—Other methods were not successful. F. e. s. T. O. Jones, R. E. Halter, and W. L. Myers, *Am. Soc.* 75, 6055 (1953).

**Phosphorus trichloride/pyridine**

**Carboxylic acid amides from carboxylic acids  
and phosphor compounds  
Peptides**

A soln. of  $\text{PCl}_3$  in pyridine added to a soln. of glycine ethyl ester in pyridine, after 0.5 hr. heated 3 hrs. with N-carbobenzoxyglycine on a steam bath  $\rightarrow$  N-carbobenzoxyglycylglycine ethyl ester. Y: 91%.—No racemization takes place in this process. F. e., also with isolation of the intermediate, s. Goldschmidt et al., *A.* 580, 68 (1953); *B.* 86, 1116 (1953).

**Sulfuric acid**

**N-Acylation**

s. 5, 302; s. a. J. R. E. Hoover and A. R. Day, *Am. Soc.* 76, 4148 (1954)

**Pyrimido[4,5-b]pyrazines**

s. 1, 345; 7, 458; s. a. F. Korte, *B.* 87, 1062 (1954)

**Iodine**

**Sec. from prim. amines and phenols**

s. 9, 713

## Oxazolidines from 2-aminoalcohols

469.

A mixture of equivalent amounts of 2-( $\alpha,\gamma$ -dimethylbutyl)amino-3-methyl-3-butanol and butyraldehyde with benzene azeotropically distilled in the presence of a trace of iodine until the theoretical quantity of water has been collected  $\rightarrow$  2-n-propyl-3-( $\alpha,\gamma$ -dimethylbutyl)-4,5,5-trimethyloxazolidine. Y: 80%. E. D. Bergmann, S. Pinchas, et al., Am. Soc. 73, 5662 (1951); f. e. and limitations s. R. 71, 168, 229, 237 (1952); Am. Soc. 75, 358 (1953).

Ammonium chloride

 $\text{NH}_4\text{Cl}$ 

## Glycosaminides

 $\text{OH} \rightarrow \text{N}<$ 

470.

N-Acetylglucosamine, p-toluidine, and  $\text{NH}_4\text{Cl}$  in abs. methanol refluxed 4 hrs.  $\rightarrow$  N-acetyl-D-glucosamine-p-toluidide. Y: 89%. F. e. s. A. Bertho and D. Koziollek, B. 87, 934 (1954).

Hydrochlorides

## Oxazolidines from 2-aminoalcohols

471.

A soln. of l-ephedrine hydrate in acetone mixed with a soln. of l-ephedrine hydrochloride in abs. methanol, and refluxed 4 hrs.  $\rightarrow$  acetone-l-ephedrine. Y: 90%. K. Freudenberg and J. Geiger, A. 575, 145 (1952).

Hydrochloric acid

HCl

Aminodesoxybenzoins from benzoins

←

Voigt reaction

472.

A mixture of benzoin, 2-aminopyridine, toluene, and concd. HCl refluxed 20 hrs. with a water separator  $\rightarrow$  N-(2-pyridyl)desylamine. Y: 83%. I. A. Kaye, C. L. Parris, and W. J. Burlant, *Am. Soc.* **75**, 746 (1953); cf. *Synth. Meth.* **4**, 382.

2,4-Dinitrophenylhydrazones

CO  $\rightarrow$  C:N·NHR

s. 1, 347/8; of carbohydrates s. L. M. White and G. E. Secor, *Am. Soc.* **75**, 6343 (1953)

Phenoxazine ring

○

473.

5-Di-n-propylamino-2-nitrosophenol hydrochloride and concd. HCl added to a suspension of 1-(N-benzyl)naphthylamine in ethanol, and refluxed 3 hrs. with stirring  $\rightarrow$  5-benzylamino-9-di-n-propylamino-benzo[a]phenoxazonium chloride. Y: 64%. F. e. and methods s. M. L. Crossley et al., *Am. Soc.* **74**, 573, 578, 584 (1952).

Pyrazine ring synthesis

Pyrimido[4,5-b]pyrazines

s. 4, 400; s. a. B. J. Magerlein and D. J. Weisblat, *Am. Soc.* **76**, 3033 (1954)

Nickel

Ni

Prim. amines from oxo compounds

CO  $\rightarrow$  CHNH<sub>2</sub>

s. 3, 350; s. a. D. G. Norton et al., *J. Org. Chem.* **19**, 1054 (1954)

Via intermediates

v.i.

**Sec. amines from oxo compounds  
via azomethines**CO  $\rightarrow$  CHNHR

s. 1, 354; s. a. D. G. Norton et al., J. Org. Chem. 19, 1054 (1954)

**Subst. carboxylic acid amides  
from carboxylic acids  
via carboxylic acid chlorides**COOH  $\rightarrow$  COCl  $\rightarrow$  CON<

s. 9, 627

**Mixed and partial dicarboxylic acid derivatives. — Avoidance of isomerization.** A mixture of methyl  $\beta$ -carboxybutyrate, oxalyl chloride, and dry benzene warmed 3 hrs. at 30-40°, the solvent evaporated at 40°/12 mm, the product taken up in benzene, again evaporated, this operation repeated twice, then dissolved in dry ether, and carefully treated at 0° with aniline in the same solvent  $\rightarrow$  methyl  $\beta$ -phenylcarbamylbutyrate. Y: 79%.—By this mild procedure, isomerization (cf. Synth. Meth. 8, 188 is avoided. Also with the isomer s. J. E. H. Hancock and R. P. Linstead, Soc. 1953, 3490.

**Peptides**

s. 5, 316; s. a. D. Ben-Ishai, J. Org. Chem. 19, 62 (1954)

**Peptide synthesis with chlorophosphites**COOH  $\rightarrow$  CON<

o-Phenylene chlorophosphite added to a soln. of carbobenzoxyglycyl-L-phenylalanine in benzene containing triethylamine, filtered, then refluxed 15 min. with ethyl glycinate  $\rightarrow$  ethyl carbobenzoxyglycyl-L-phenylalanylglycinate. Y: 84%.—This procedure is simple, rapid, and gives good yields, with no apparent racemization of optically active derivatives. F. e. s. G. W. Anderson and R. W. Young, Am. Soc. 74, 5307 (1952).

### Carboxylic acid hydrazides from carboxylic acids

via carboxylic acid esters. Excess ethereal diazomethane added to a suspension of 15.3 g. carbobenzoxy-DL-serine in ethyl acetate, after dissolution of the amino acid evaporated in vacuo, dissolved in abs. ethanol, 85% hydrazine hydrate added, and allowed to stand overnight at room temp. → 14.9 g. carbobenzoxy-DL-serine hydrazide. E. A. Poppenoe, D. G. Doherty, and K. P. Link, *Am. Soc.* 75, 3469 (1953); *estimation of diazomethane* s. R. F. Raffauf, A. L. Farren, and G. E. Ulliot, *Am. Soc.* 75, 2576 (1953); *relative reactivity of functional groups towards diazomethane*, -COOH > COBr > COCl > OH > COCH<sub>3</sub>, s. A. J. Kosak, C. W. Huntington, and J. R. MacGregor, *Am. Soc.* 76, 4481 (1954).

### via carboxylic acid chlorides

s. 9, 503

### Hydantoins from α-isocyanatocarboxylic acid esters

A mixture of ethyl α-isocyanatoisobutyrate and concd. NH<sub>3</sub> vigorously shaken, warmed 1 hr. at 60°, evaporated to dryness, then evaporated twice with aq. HCl to dryness → 5,5-dimethylhydantoin. Y: 86%. F.e.s. S. Goldschmidt and M. Wick, *A.* 575, 217 (1952).

### Nitrogen †

Without additional reagents

w.a.r.

Sec. from prim. amines

Exchange of substituents of  
pyrimido[4,5-b]pyrazines

s. 9, 534

**Sec. and tert. amines  
from quaternary ammonium salts  
by transamination**

Benzylamine added to (3-hydroxy-2-pyridylmethyl)trimethylammonium bromide, then warmed 1.5 hrs. at 50° with stirring, and the product isolated as the dihydrochloride  $\rightarrow$  2-benzylaminomethyl-3-pyridol dihydrochloride. Y: 71%.—This reaction can be performed with amines which do not undergo the Mannich reaction or might react differently, as in the case of prim. amines. F. e. s. A. Stempel and J. A. Aeschlimann, *Am. Soc.* **74**, 3323 (1952).

**Substitution of carboxylic acid amides**

Homopiperonylamine and 4-pyridylacetamide in tetralin heated 2 hrs. at 200°  $\rightarrow$  N-(4-pyridylacetyl)homopiperonylamine. Y: 73%. C. R. Noller and E. A. Wunderlich, *Am. Soc.* **74**, 3835 (1952).

**Substitution of carboxylic acid thioamides  
Dithiooxamides**

A mixture of dithiooxamide and excess aq. 33% ethylamine refluxed 15 min. on a water bath whereby a vigorous  $\text{NH}_3$ -evolution takes place after 10 min.  $\rightarrow$  N,N'-diethyldithiooxamide. Y: 88%. F. e. s. H. M. Woodburn and C. E. Sroog, *J. Org. Chem.* **17**, 371 (1952).

## Ureas from amines and carboxylic acid azides

81.

Hippuryl azide added to a soln. of 1,3,4,6-tetraacetyl- $\beta$ -D-glucosamine in ethyl acetate, and allowed to stand overnight at room temp.  $\rightarrow$  N-(benzamidoethylcarbamyl)-1,3,4,6-tetraacetyl- $\beta$ -D-glucosamine. Y: 73%.—No amide is obtained (cf. Synth. Meth. 6, 226; 7, 476/7), since the azide undergoes Curtius rearrangement before reacting with the amine. E. A. Popenoe, D. G. Doherty, and K. P. Link, Am. Soc. 75, 3469 (1953); s. a. J. W. Hinman, E. L. Caron, and H. N. Christensen, Am. Soc. 72, 1620 (1950).

## Semicarbazides from ureas

482.

Mesitylurea. a 50% soln. of hydrazine hydrate, and ethanol refluxed until evolution of  $\text{NH}_3$  ceases after ca. 72 hrs.  $\rightarrow$  mesitylsemicarbazide. Y: 87%. J. Packer, J. Vaughan, and T. W. Watts, Soc. 1952, 2654.

Cleavage of N-thioacylamidines  
Diamidides

483.

N-Thiobenzoylbenzamidine dissolved in 2 N abs. ethanolic  $\text{NH}_3$ , and evaporated in vacuo after 30 min.  $\rightarrow$  thiobenzamide (Y: 88%) and, after treatment with picric acid, benzamidinium picrate (Y: 74%). Also cleavage with amines, and with amidines to diamidides.  $\text{ArC}(\text{:NH})\text{N}:\text{C}(\text{NH}_2)\text{Ar}$ , s. D. A. Peak, Soc. 1952, 215.

### Amine salts of N-nitramines from N-nitrourethans

Ethyl N-nitro-N-isopropylcarbamate (prepn. s. Am. Soc. 73, 5043 (1951)) allowed to react with cyclohexylamine in ether  $\rightarrow$  cyclohexylamine salt of isopropyl-N-nitramine (Y: 94.5%) and ethyl N-cyclohexylcarbamate (Y: 63%).—The salts may be used for the identification of amines and N-nitramines, and the reaction is also useful for the identification of N-nitrocarbamates. F. e. s. H. M. Curry and J. P. Mason, Am. Soc. 73, 5041 (1951).

### 4-Subst. 2-acylimidazoles from $\alpha$ -halogenoketones via $\alpha$ -azidoketones

A cold aq. soln. of  $\text{NaN}_3$  added at 0–5° to a soln. of phenacyl bromide in ethanol and glacial acetic acid, and allowed to stand 24 hrs. in the refrigerator with intermittent shaking  $\rightarrow$  phenacyl azide (Y: 93%) dissolved in trichlorobenzene, resorcinol dimethyl ether, or diphenyl ether, and heated between 180 and 240° for 30 min. or until no more  $\text{N}_2$  and water vapor is evolved  $\rightarrow$  2-benzoyl-4(or 5)-phenylimidazole (Y: 64%). F. e. and limitation s. J. H. Boyer and D. Straw, Am. Soc. 74, 4506 (1952).

### Imidazole ring from carboxylic acid amides Bi(benzimidazoles)

4.4 g. oxamide, 10.8 g. o-phenylenediamine, and ethylene glycol refluxed 3 hrs.  $\rightarrow$  9.2 g. crude 2,2'-bi(benzimidazolyl). F. e. s. E. S. Lane, Soc. 1953, 2238.

**Copazolines**

87.

A suspension of 15 g. 3-aminoisonicotinic acid and 12 g. thiourea in mineral oil heated 5 hrs. at 170-180° with stirring → 21 g. 2-thiocopazoline-2,4(1H,3H)dione. H. H. Fox, J. Org. Chem. 17, 547 (1952).

**Pyrimido[4,5-b]pyrazines from pyrazines**

88.

A soln. of 3-carbethoxypyrazine-5,6-diphenylpyrazine in ethanol satd. with anhydrous NH<sub>3</sub>, then heated 6 hrs. at 155° in a sealed tube → 6,7-diphenylillumazine. Y: 90%. F. methods s. E. C. Taylor, Jr., J. A. Carbon, and D. R. Hoff, Am. Soc. 75, 1904 (1953).

*Sodium hydroxide**NaOH***Hydroxylamines from quaternary ammonium salts**

←

s. 9, 553

**Nitrones from pyridinium salts**

←

**Kröhnke aldehyde synthesis****α-Ketoaldehydes from α-halogenoketones**

s. 1, 198/9; s. a. K. Balenović, D. Cerar, and L. Filipović, J. Org. Chem. 18, 868 (1953)

*Potassium hydroxide/alcohol**KOH***Replacement of nitro groups**

←

s. 9, 491

Sodium/alcohol

NaOR

## Selective N-alkylation

NH  $\rightarrow$  NR

Trimethylphenylammonium p-toluenesulfonate added to a soln. of Na in alcohol, filtered, the filtrate mixed with 6-(p-tolylsulfonamido)quinoline, the ethanol distilled off, and the residue heated 50 min. at 107–112° with occasional stirring  $\rightarrow$  6-(N-methyl-p-tolylsulfonamido)quinoline. Y: 60%. A. M. Simonov, *Ж.22*, 2006 (1952); C. A. 47, 9328g.

Phenyllithium

 $C_6H_5Li$ 

## Diazo compounds from sulfonic acid azides

 $CH_2 \rightarrow CN_2$ 

A soln. of cyclopentadiene in ether added dropwise with stirring during 30 min. to a cooled soln. of phenyl-Li (from bromobenzene and Li), stirring continued for 1 hr. at room temp., forced under  $N_2$ -pressure in a slow, steady stream during 1 hr. into a cooled, stirred soln. of p-toluenesulfonyl azide in dry ether  $\rightarrow$  diazocyclopentadiene (Y: 35%) and p-toluenesulfonamide (Y: 29%). W. von E. Doering and C. H. DePuy, *Am. Soc.* 75, 5955 (1953).

Potassium carbonate

 $K_2CO_3$ 

## Replacement of nitro groups

 $\leftarrow$ 

**Partial replacement by amino groups.** An intimate mixture of 4,5-dinitro-2-acetamidobenzoic acid and anhydrous K-carbonate added to aniline, and heated 30 min. on a steam bath  $\rightarrow$  5-nitro-4-anilino-2-acetamidobenzoic acid. Y: 92%. F. e. s. H. Goldstein and R. Jaunin, *Helv.* 34, 1860 (1951); with KOH/alcohol s. *Helv.* 34, 2222.

## Sodium nitrite

NaNO<sub>2</sub>3-Nitrosooxazolidines from  
2 2-aminoalcohol molecules

○

92.

Aq. NaNO<sub>2</sub> added dropwise with stirring at 0-5° to a soln. of 2-amino-1-butanol in aq. acetic acid, stirring continued 1 hr. at the same temp., and overnight at room temp. → 2-propyl-4-ethyl-3-nitrosoöxazolidine. Y: 49-52%. H. R. Nace and M. H. Gollis, Am. Soc. 74, 5189 (1952).

## Copper

Cu

 $\alpha$ -Aminoketones from  $\alpha$ -diazoketonesCOCHN<sub>2</sub> → COCH<sub>2</sub>N<

93.

Piperidine dissolved in abs. ethanol, the soln. stirred with Cu-bronze (Naturkupfer C) at 45°, a soln. of  $\alpha$ -diaoacetophenone in abs. ethanol added slowly at a rate to maintain the temp. at 50° without external heating →  $\alpha$ -(1-piperidyl)acetophenone. Y: 80%. P. Yates, Am. Soc. 74, 5376 (1952).

## Silver carbonate

Ag<sub>2</sub>CO<sub>3</sub>

## Substitution of amidines

NH → NR

94.

Formamidine hydrochloride and Ag-carbonate added to a suspension of 1 g. L-leucine in formamide → 0.85 g. formimino-L-leucine. F. e. s. F. Micheel and W. Flitsch, A. 577, 234 (1952).

Aluminum chloride

AlCl<sub>3</sub>

## Azines from hydrazones

1 g. benzophenone hydrazone added all at once to boiling aq. AlCl<sub>3</sub>. and heating continued until the product precipitates → 0.8 g. benzophenone azine. D. E. Pearson, K. N. Carter, and C. M. Greer, Am. Soc. 75, 5905 (1953).

Acetic acid

CH<sub>3</sub>COOH

## Pyrazoles from ethyleniminoketones

*cis*-1-Cyclohexyl-2-phenyl-3-(*p*-phenylbenzoyl)ethylenimine warmed 15 min. at 40-50° in an ethanol-chloroform mixture containing glacial acetic acid and phenylhydrazine, until a clear soln. is obtained, then allowed to stand 12 hrs. at room temp. → 1,5-diphenyl-3-(*p*-phenyl)pyrazole. Y: 84%. F. e., pyrazolines from the *trans*-isomers, s. N. H. Cromwell and M. A. Graff, J. Org. Chem. 17, 414 (1952).

## Isoalloxazines

s. 4, 418; s. a. E. E. Haley and J. P. Lambooy, Am. Soc. 76, 2926 (1954)

Sulfate

## Labeled purines by transformylation

4,5,6-Triaminopyrimidine and N-formyl-C<sup>14</sup>-morpholine heated 80 min. at 200° in a slow N<sub>2</sub>-stream → adenine. Y: 92%. R. Abrams and L. Clark, Am. Soc. 73, 4609 (1951).

Hydrochloric acid

HCl

**Benzimidazole derivatives in identification of carbohydrates**

98.

7-Desoxy-L-manno-L-gala-heptonic phenylhydrazide allowed to react with o-phenylenediamine in the presence of HCl  $\rightarrow$  2-(L-manno-L-gala-hepto-1,2,3,4,5-pentahydroxyhexyl)benzimidazole. Y: 70%. Also from salts and lactones s. D. A. Rosenfeld et al., Am. Soc. 73, 5907, 4907 (1951); method s. S. Moore and K. P. Link, J. Biol. Chem. 133, 293 (1940).

**Oxazolone ring opening with dimerization**

C

99.

4 g. 4-aminomethylene-2-phenyl-5-oxazolone added to a soln. of dry HCl in methanol, and allowed to stand 5 days at 18-20°  $\rightarrow$  4 g. dimethyl  $\beta,\beta'$ -iminodi-( $\alpha$ -benzoylaminoacrylate). I. T. Strukov, Ж. 23, 1344 (1953); C. A. 48, 117b.

Via intermediates

v.i.

**Subst. carboxylic acid amides from carboxylic acid hydrazides via carboxylic acid azides**CONHNH<sub>2</sub>  $\rightarrow$  CONHR**Peptide synthesis**

s. 8, 497; s. a. E. A. Steck, R. P. Brundage, and L. T. Fletcher, Am. Soc. 76, 3225 (1954); also sec. amines s. L. Katz and M. S. Cohen, J. Org. Chem. 19, 767 (1954)

**Exchange of substituents of pyrimidines**

500.

A mixture of 4,6-dichloro-5-ethyl-2-methylpyrimidine and concd. aq.  $\text{NH}_3$  heated 9 hrs. at  $132\text{--}140^\circ$  in a sealed tube  $\rightarrow$  4-amino-6-chloro-5-ethyl-2-methylpyrimidine. Y: 88.9%.—At higher temp., both chloro substituents are replaced by amino groups. F. e. s. H. R. Henze, W. J. Clegg, and C. W. Smart, *J. Org. Chem.* **17**, 1320 (1952); s. a. G. B. Brown and V. Spicer Welicky, *J. Biol. Chem.* **204**, 1019 (1953).

**2-Ethyleneamines from  $\beta,\gamma$ -ethylenehalides with subsequent N-acylation**

501.

A soln. of  $\gamma$ -bromocrotonic acid in liq.  $\text{NH}_3$  allowed to evaporate slowly, water carefully added, evaporated to dryness on a steam bath, 2 equivalents of NaOH added, again evaporated to dryness, taken up in a little water, and treated with 1 equivalent of NaOH and 1 equivalent of phenylacetyl chloride with cooling and stirring  $\rightarrow$  crude  $\gamma$ -phenylacetylaminocrotonic acid. Y: 83%.—Treatment with liq.  $\text{NH}_3$  in dry dioxane was not successful. D. Todd and S. Teich, *Am. Soc.* **75**, 1895 (1953).

**Sec. from prim. amines and halides**Hal  $\rightarrow$  NHR

s. 9, 930;  $\alpha$ -aminocarboxylic acid s. F. Blicke and P. E. Norris, *Am. Soc.* **76**, 3213 (1954)

**Carboxylic acid amides from carboxylic acid chlorides Lower aliphatic amides**COCl  $\rightarrow$  CONH<sub>2</sub>

502.

A soln. of  $\alpha$ -ethylbutyryl chloride in dry benzene added dropwise during 1 hr. to benzene heated on a water bath while a stream of  $\text{NH}_3$  is passed through and continued for 20 min. after the addition  $\rightarrow$   $\alpha$ -ethylbutyramide. Y: 91%.—If  $\text{NH}_3$  is passed directly into the soln. of the acid chloride, large quantities of diamides are formed. F. e. s. G. E. Philbrook, *J. Org. Chem.* **19**, 623 (1954).

**Subst. carboxylic acid amides  
from carboxylic acid chlorides**

s. 9, 474

**Carboxylic acid hydrazides  
from carboxylic acids  
via carboxylic acid chlorides**

03.

A soln. of o-duroylbenzoic acid and  $\text{SOCl}_2$  refluxed 1 hr., excess  $\text{SOCl}_2$  distilled off, and the resulting acid chloride allowed to stand 24 hrs. with 85% -hydrazine hydrate at room temp.  $\rightarrow$  o-duroylbenzoylhydrazine. Y: 90%. R. C. Fuson and W. C. Hammann, Am. Soc. 74, 1626 (1952).

**Carboxylic acid carbobenzoxyhydrazides**

04.

A soln. of phthalylglycyl chloride in ethyl acetate added to an ice-cold soln. of carbobenzoxyhydrazine in the same solvent, and the mixture kept 6 hrs. at room temp.  $\rightarrow$  phthalylglycine carbobenzoxyhydrazide. Y: 89%. F. e. s. K. Hofmann et al., Am. Soc. 74, 470, 476 (1952).

**Isothiocyanates from amines**

s. 1, 464; s. a. Chem. and Ind. 1954, 934

**S-Thiocarbamic acid esters from  
amines and phenylthiocarbonyl chloride**

s. 9, 536

**Sym. thioureas from amines**

505.

A soln. of 10 g. 4,6-diaminocinnoline in 50% aq. acetone refluxed 0.5 hr. with thiocarbonyl dichloride  $\rightarrow$  13 g. N,N'-di-(4-amino-6-cinnolyl)-thiourea dihydrochloride. F. e. s. J. S. Morley and J. C. E. Simpson, Soc. 1952, 2617.

*Lithium**Li***Tert. from prim. amines**

s. 3, 366; s. a. J. Org. Chem. 19, 1074 (1954)

*Sodium hydroxide**NaOH***Acylation of aminocarboxylic acids**

s. 9, 501

**Selective N-acylation of aminohydroxycarboxylic acids**

506.

An aq. soln. of  $\beta$ -phenylserine and NaOH, and a soln. of benzoyl chloride in benzene stirred together while aq. NaOH is added slowly  $\rightarrow$  N-benzoyl- $\beta$ -phenylserine. Y: 80%. E. D. Bergmann, H. Bendas, and W. Taub, Soc. 1951, 2673.

**Carbalkoxy derivatives of amines**

s. 7, 366, 490; carbo-p-nitrobenzoxy derivatives s. D. T. Gish and F. H. Carpenter, Am. Soc. 75, 950 (1953)

**Selective N-carbalkoxylation**

507.

A soln. of p-nitrobenzyl chloroformate in dioxane and 4 N NaOH added portionwise during ca. 1 hr. to a soln. of L-arginine monohydrochloride

in aq. NaOH-NaHCO<sub>3</sub> of pH 10.0 → N<sup>α</sup>-p-nitrobenzoxycarbonyl-L-arginine. Y: 88%.—The guanido group is blocked with a proton. N<sup>ω</sup>-Isomer s. 49. D. T. Gish and F. H. Carpenter. *Am. Soc.* 75, 5872 (1953); selective N-carbalkoxylation of aminohydroxycarboxylic acids s. J. A. Moore et al., *Am. Soc.* 76, 2884 (1954).

### Carbalkoxycyanamides

508.

Ethyl chloroformate gradually added with stirring below 20° to cyanamide and NaOH in water, stirring continued 30 min., chloroform added, cooled, and acidified with concd. HCl → carbethoxycyanamide. Y: 88.5%. F. e., and decomposition products. s. D. W. Kaiser and J. T. Thurston, *J. Org. Chem.* 17, 185 (1952).

### Phenoxazines

○

509.

A soln. of NaOH in 50% aq. alcohol slowly added to a stirred refluxing soln. of 8.5 g. o-benzylaminophenol (prepn. s. 80) and 9 g. 1-chloro-2,4-dinitrobenzene in alcohol, heating continued for 1 hr. → 11.3 g. 10-benzyl-3-nitrophenoxazine. F. e. s. B. Boothroyd and E. R. Clark. *Soc.* 1953, 1499.

### Potassium hydroxide

KOH

### Betaines from aminocarboxylic acids

←

510.

A soln. of methyl iodide in methanol added to an aq. soln. of β-hydroxy-γ-aminobutyric acid and KOH, refluxed slowly for 36 hrs., at a pH of ca. 5.5, and the product purified by extraction with phenol satd. with water from an aq. soln. → DL-carnitine. Y: 78%. H. E. Carter and P. K. Bhattacharyya, *Am. Soc.* 75, 2503 (1953).

### Acyldicyanodiamides

NH → NAc

511.

A mixture of dicyanodiamide, 85%-KOH pellets, and acetone stirred vigorously at 10° for 1 hr., then benzoyl chloride added with stirring at 0-5° → benzoyldicyanodiamide (startg. m. f. 219, 417). Crude Y: 89%. F. e., also with carboxylic acid anhydrides. s. P. Adams et al., *J. Org. Chem.* 17, 1162 (1952).

*Potassium hydroxide/acetone***Selective N-alkylation**

NH → NR

**Substitution of carboxylic acid amides**

512.

Powdered KOH added to p-benzamidodiphenylamine in acetone, the hot mixture refluxed gently while methyl iodide in acetone is added, and the product isolated after 20 min. → p-(N-methylbenzamido)diphenylamine. Y: 90%.—When large differences in proton availability exist, the method may also be applied to the selective methylation of one amino group in the presence of another: p-Amino-p'-nitrodiphenylamine → p-amino-p'-nitrodiphenylmethanamine. Y: 83%. F. e. s. I. J. Pachter and M. C. Kloetzel, *Am. Soc.* **74**, 1321 (1952).

*Sodium/alcohol*

NaOR

**Ring closure due to steric hindrance**

513.

N,N'-Ditosyl-o-phenylenediamine added to a refluxing soln. of Na in n-butanol, refluxed until dissolved, 1,4-dibromobutane added, and refluxing continued until alkaline reaction disappears → N,N'-ditosyl-N,N'-tetramethylene-o-phenylenediamine. Y: 91%.—Polycondensation is inhibited by steric hindrance. It is therefore not necessary to apply high dilution (cf. 971). F. e. and limitations s. H. Stetter, *B.* **86**, 197 (1953); *dimethylformamide* as solvent s. *B.* **87**, 566 (1954).

*Lithium amide*LiNH<sub>2</sub>**N-Alkylation**

NH → NR

**Substitution of carboxylic acid amides**

514.

A mixture of 2-acetamidothiophene, benzyl chloride, and LiNH<sub>2</sub> in dry toluene refluxed 24 hrs. → N-benzyl-N-(2-thienyl)acetamide. Y: 84%. I. A. Kaye, C. L. Parris, and N. Weiner, *Am. Soc.* **75**, 744 (1953); N-alkylation of 2-aminothiazoles s. *Am. Soc.* **74**, 2921 (1952).

## Sodium amide

 $\alpha, \beta$ -Acetylene-prim-amines  
from  $\alpha, \beta$ -acetylenechlorides

5.

Methyl-n-amylethynylcarbinyl chloride in anhydrous ether added dropwise during 1 hr. with stirring to  $\text{NaNH}_2$  in liq.  $\text{NH}_3$ , and stirring continued for 1 hr.  $\rightarrow$  methyl-n-amylethynylcarbinyl amine. Y: 48-70%. F. e. and limitation s. G. F. Hennion and E. G. Teach, Am. Soc. 75, 1653 (1953).

## N-Alkylation

Transalkylation of *tert.* amines

A mixture of dodecanol, triethylamine, and Cu-Cr-Ba oxide heated 10 hrs. at 250° and 380 atm. of H<sub>2</sub> → diethyldodecylamine. Y: 66%. F. e. s. H. J. Schneider, H. Adkins, and S. M. McElvain, *Am. Soc.* 74, 4287 (1952).

Via intermediates

v.i.

Shortened Curtius degradation

COOH → NH<sub>2</sub>

Amines from carboxylic acids

via acid chlorides, acid azides, and sym. ureas

An aq. soln. of Na-azide added at 0-5° with stirring to a soln. of 2-nitroveratric acid chloride (prepared from the acid with SOCl<sub>2</sub>), stir-

ring continued 0.5 hr. at 0°, poured into ice-water, the crude azide dried, dissolved in dry benzene, heated gently at first and then at reflux 4-6 hrs. until N<sub>2</sub>-evolution ceases, cooled to room temp., vigorously stirred and treated cautiously with cold 50% -KOH soln., whereby the sym. urea precipitates, then the benzene slowly distilled from the reaction mixture, whereby the urea is hydrolyzed → 4-amino-3-nitroveratrole. Y: 85%. R. C. Elderfield and G. L. Krueger, *J. Org. Chem.* 17, 358 (1952).

## Elimination

### Hydrogen ↑

*Tetramethylammonium acetate*

**Indazoles from diazonium salts  
or N-nitrosoacylamines.  
Intramolecular coupling**

552.

o-Toluenediazonium chloride added to a soln. of dry tetramethylammonium acetate in alcohol-free chloroform, and allowed to stand 1 day at room temp. → indazole. Y: 87%.

Crude nitrosobenz-o-toluidide in dry alcohol-free chloroform allowed to stand several days at room temp. → indazole. Y: 92%.

In alcohol, the yields of indazole are low, and ethyl alcohol is oxidized to acetaldehyde (Y: up to 81%). R. Huisgen and H. Nakaten, *A.* 573, 181 (1951).

*Nitrobenzene/sodium hydroxide*

**Aldehydes from quaternary ammonium salts  
via hydroxylamines and nitrones**

553.

Phenylhydroxylamine added at room temp. to a soln. of gramine methosulfate in methanol, made alkaline with 2 N NaOH, nitrobenzene added,

refluxed 1 hr., more 2 N NaOH added, steam-distilled, and the product isolated from the residue → 3-indolealdehyde. Y: 87-91%. J. Thesing. B. 87, 507 (1954).

*Ferric chloride*

$FeCl_3$

**3-Mercapto-1,2,4-triazoles  
from thiosemicarbazones  
via isothiosemicarbazones**

554.

A mixture of 4-acetamidobenzaldehyde thiosemicarbazone and benzyl chloride refluxed 1.5 hrs. → 4-acetamidobenzaldehyde 3-benzyl-3-thiopseudosemicarbazone hydrochloride (Y: 73%), the crude compound dissolved in water, and to the boiling soln. aq. 10%- $FeCl_3$  added portionwise → 3-benzylmercapto-5-(4-acetamidophenyl)-1,2,4-triazole (Y: 73%). F. e. s. R. Duschinsky and H. Gainer, Am. Soc. 73, 4464 (1951).

**Lactam ring closure**

○

s. 9, 949

**Racemization via lactams**

555.

Mono-Na-L-glutamate and solid  $NH_4Cl$  thoroughly mixed, heated at 230-235° until evolution of  $NH_3$  and water vapor ceases, heating continued 1 hr. with frequent stirring, refluxed 5 hrs. with 6 N HCl, and the aq. soln. of the crude product adjusted approximately to pH 3 with

concd. aq.  $\text{NH}_3 \rightarrow$  DL-glutamic acid monohydrate. Y: 51-53%.—L-Pyrrolidone carboxylic acid racemizes rapidly at  $230^\circ$ . M. S. Dunn and M. P. Stoddard, *Biochem. Prep.* 2, 69 (1952).

### Indazoles from N-nitrosoacylamines

s. 9, 552

### 2,5-Piperazinediones

556.

A mixture of sarcosylglycine and ethylene glycol refluxed 30 min.  $\rightarrow$  1-methyl-2,5-piperazinedione. Y: 73%. B. H. Chase and A. M. Downes. *Soc.* 1953, 3874.

### N-Condensed heterocyclics

557.

A soln. of 1-(2'-carbomethoxyskatyl)isoquinoline in  $\alpha$ -methylnaphthalene refluxed 20 hrs.  $\rightarrow$  1,2-benzo-7,8-(2',3'-indolo)-6-quinolizone (Y: 85%), 1 g. suspended in boiling n-butanol, and Na added in small pieces  $\rightarrow$  0.9 g. 1,2-benzo-7,8-(2',3'-indolo)tetrahydroquinolizine. V. Boekelheide and Chu-tsin Liu, *Am. Soc.* 74, 4920 (1952); ring closure s. a. *Am. Soc.* 75, 3679 (1953).

### Benzoxazoles

558.

3-Nitro-2-acetamido-1-phenyl acetate heated in an oil bath at  $200^\circ$  until fused, then at  $230$ – $240^\circ$  until no more acetic acid distills  $\rightarrow$  2-methyl-4-nitrobenzoxazole. Y: 97%. C. Sannie and H. Lapin, *Bl.* 1952, 369.

Sodium hydroxide

NaOH

**Dicarboxylic acid imides  
from cyanocarboxylic acid esters  
via dicarboxylic acid amide esters**

Ethyl  $\beta$ -cyano- $\beta,\beta$ -diphenylpropionate dissolved during 2-3 hrs. in cold 85%  $\text{H}_2\text{SO}_4$ , the crude ester-amide dissolved in warm alcohol, aq. NaOH added, and immediately acidified with dil. HCl  $\rightarrow$   $\alpha,\alpha$ -diphenylsuccinimide. Y: ca. 100%. F. Salmon-Legagneur, Bl. 1952, 580.

Potassium hydroxide

KOH

**1,3,5-Triazines from acylbiurets**

Benzoylbiuret (prepn. s. 219) dissolved in aq. KOH, and acidified 2 hrs. later  $\rightarrow$  benzoguanamide. Crude Y: 98%. P. Adams et al., J. Org. Chem. 17, 1162 (1952).

Sodium/alcohol

NaOR

**Pyrimido[4,5-b]pyrazines from pyrazines**

A soln. of N-(n-butyl)-3-carbethoxyamino-5,6-diphenylpyrazinamide in a soln. of Na in abs. ethanol refluxed 10 hrs.  $\rightarrow$  3-(n-butyl)-6,7-diphenyl-2,4(1H,3H)-pteridinedione. Y: 88.8%. F. methods s. E. C. Taylor, Jr., J. A. Carbon, and D. R. Hoff, Am. Soc. 75, 1904 (1953); s. a. W. Pfeleiderer and J. Geisler, B. 87, 1274 (1954).

Ammonia

NH<sub>3</sub>

**1,3,5-Triazines from carbalkoxydicyanodiamides via carbalkoxyguanylureas**

562.

Carbethoxydicyanodiamide added to 18.5% -HCl, heating continued several min. after the exothermic reaction has subsided → carbethoxyguanylurea hydrochloride (Y: 85.5%) suspended in water and the equivalent amount of aq. NH<sub>3</sub> added → carbethoxyguanylurea. (Y: ca. 100%) heated with aq. NH<sub>3</sub> → ammelide (Y: 85%). D. W. Kaiser and J. T. Thurston, *J. Org. Chem.* 17, 185 (1952).

*Pyridine/carboxylic acid chloride*  
s. *Carboxylic acid chloride/pyridine*

*Phosphorus trichloride**PCl<sub>3</sub>*

Diphenylacetamide refluxed 2.5 hrs. with  $\text{PCl}_3$  in benzene on a steam bath  $\rightarrow$  diphenylacetonitrile. Y: 80%. F. Salmon-Legagneur, *Bl.* 1952, 580.

*Phosphorus pentachloride**PCl<sub>5</sub>*

**Lactam ring closure**  
**with simultaneous formation of**  
**carboxylic acid chlorides from carboxylic acids**

$\text{PCl}_5$  added in one portion at  $0^\circ$  to a suspension of tosyl-L-glutamic acid in dry ether, and allowed to warm to room temp. toward the end of the reaction  $\rightarrow$  1-tosylpyroglutamyl chloride (startg. m. f. 402). Y: 90%. J. M. Swan and V. du Vigneaud, *Am. Soc.* 76, 3110 (1954).

*Copper chromite* *$\text{CuCr}_2\text{O}_4$* 

**Decahydrodipyrrolo[a,d]pyrazines**  
**Alcohols from carboxylic acid esters**

Butyl pyroglutamate hydrogenated 4 hrs. with  $\text{CuCr}_2\text{O}_4$  in dioxane at  $150^\circ$ , the catalyst filtered off, the solvent completely removed by vacuum distillation, and the crude 5-hydroxymethyl-2-pyrrolidone (Y: 96% when isolated) hydrogenated 5.5 hrs. with  $\text{CuCr}_2\text{O}_4$  in dioxane at  $250^\circ$   $\rightarrow$  decahydrodipyrrolo[a,d]pyrazine (Y from pure 5-hydroxymethyl-2-pyrrolidone almost 100%). Over-all Y: 77%.—Removal of the butanol formed in the first step prevents the formation of N-butyl-2-hydroxymethylpyrrolidine as by-product in the second step. E. Segel, *Am. Soc.* 74, 851 (1952).

*Hydrochloric acid**HCl***Hydantoins from  $\alpha$ -ureidocarboxylic acids**

s. 9, 404

Hydrobromic acid

HBr

**Different reactivity of halides**

570.

3-Phenyl-5- $\gamma$ -hydroxypropylhydantoin (prepn. s. 404)

treated at 125° with dry HCl-gas  
for 2 hrs.  $\rightarrow$  3-phenyl-5- $\gamma$ -chloro-  
propylhydantoin. Y: 77%.

heated with 48%-HBr 2 hrs. at  
90°  $\rightarrow$  3-phenyl-1,5-trimethylene-  
hydantoin. Y: 71%.

R. Gaudry, Can. J. Chem. 29, 544 (1951); different reactivity of halides  
s. a. Synth. Meth. 7, 567.

**Pyrido[1,2-a]pyrimidin-2-ones**

571.

48%-HBr added to 2-imino-1(2H)-pyridinelactic acid in water, and  
evaporated to dryness at room temp. under a stream of air  $\rightarrow$  3,4-di-  
hydro-3-hydroxy-2H-pyrido[1,2a]pyrimidin-2-one hydrobromide. Y:  
100%. R. Adams and I. J. Pachter, Am. Soc. 74, 4906 (1952).

Potassium ferricyanide

 $K_3[Fe(CN)_6]$ **Hydroxyindoles**

572.

An aq. soln. of K-ferricyanide and  $\text{NaHCO}_3$  added with stirring during  
10 min. to an aq. soln. of 2,5-dihydroxyphenylalanine monohydrate and

NaHCO<sub>3</sub>, extracted with peroxide-free ether when the color has become pale yellow → 5-hydroxyindole. Y: 85%.—Similarly from 2,5-dihydroxy-β-phenylethylamine. Y: 70%. R. I. T. Cromartie and J. Harley-Mason, Soc. 1952, 2525; 1954, 1165.

**Carbon  $\uparrow$** **HalRem  $\uparrow$  C***Without additional reagents**w.a.r.***Cleavage of silanes to halogenosilanes**SiR  $\rightarrow$  SiHal

593.

Br added slowly with stirring to 1-(triethylsilyl)indene  $\rightarrow$  triethylbromosilane. Y: 83.1%. F. e. s. L. H. Sommer and N. S. Marans, Am. Soc. 73, 5135 (1951); s. a. J. J. McBride, Jr., and H. C. Beachell, Am. Soc. 74, 5247 (1952).

*Hydrochloric acid**HCl***Monoalkyl from dialkyl mercury compounds**RHgR'  $\rightarrow$  RHgCl

594.

An ethereal soln. of allylethylmercury (prepn. s. 723) warmed with alcohol satd. with HCl  $\rightarrow$  ethyl-HgCl. Y: 70%. E. Rothstein and R. W. Saville, Soc. 1952, 2987.

**Formation of Hal—C Bond****Uptake****Addition to Oxygen and Carbon****HalC  $\downarrow$  OC***Without additional reagents**w.a.r.***Halogenoquinols from quinones**

←

595.

Dry HCl passed slowly into a soln. of 2,5-toluquinone in chloroform at room temp. with water-cooling for 1 hr.  $\rightarrow$  4-chloro-2,5-toluquinol.

Y: 80%. H. Burton and D. F. G. Praill, Soc. 1952, 755; from o-quinones s. R. R. Holmes et al., Am. Soc. 76, 2400 (1954).

### Halogenolactols from oxidoketones

#### and reverse reaction

#### Lactolides from lactols

#### Oxidoketones from halogenolactolides

596.

Dry HCl passed for 15 min. into a soln. of methyl 3-keto-9 $\alpha$ ,11 $\alpha$ -oxidocholanate (prepn. s. 361) in alcohol-free chloroform, and allowed to stand for an additional 20 min.  $\rightarrow$  methyl 3 $\beta$ -hydroxy-3 $\alpha$ ,9 $\alpha$ -oxido,11 $\beta$ -chlorocholanate (startg. m. f. 272) (Y: 96%)

dissolved in methanol, 0.1 N NaOH and a drop of phenolphthalein soln. added, then refluxed ca. 5 min. until the color disappears (Y: 79%)

a hot soln. of which in 0.1 N methanolic HCl boiled 5 min.  $\rightarrow$  methyl 3 $\beta$ -methoxy-3 $\alpha$ ,9 $\alpha$ -oxido-11 $\beta$ -chlorocholanate (Y: 77.5%) dissolved in glacial acetic acid, added to Ag-acetate, and warmed 40 min. on a steam bath with occasional agitation (Y: 91%)

methyl 3-keto-9 $\alpha$ ,11 $\alpha$ -oxidocholanate

F. e., lactolides also with 48% -HBr, s. H. Heymann and L. F. Fieser, Am. Soc. 73, 5252 (1951).

#### Sulfuric acid

H<sub>2</sub>SO<sub>4</sub>

#### Dibromides from cyclic ethers

C

597.

Concd. H<sub>2</sub>SO<sub>4</sub> added cautiously to a stirred soln. of tetrahydrosylvan in 40% -HBr heated on a steam bath, heating and stirring continued for 3.5 hrs.  $\rightarrow$  1,4-dibromopentane. Y: 80%. N. J. Leonard and J. Figueras, Jr., Am. Soc. 74, 917 (1952).

## Pyridine hydrochloride

 $C_5H_5N.HCl$ 

## Halogenhydrins from oxido compounds

A soln. of ethyl N-tosyl-N-(2,3-oxidopropyl)-p-aminobenzoate and pyridine hydrochloride in ethanol-water refluxed 30 min.  $\rightarrow$  ethyl N-tosyl-N-(3-chloro-2-hydroxypropyl)-p-aminobenzoate. Y: 72.6%. D. I. Weisblat et al., Am. Soc. 75, 3625 (1953).

## Addition to Nitrogen and Carbon

HalC  $\downarrow$  NC

Without additional reagents

w.a.r.

## Imine ring opening

C

s. 4, 478; s. a. Am. Soc. 74, 4451 (1952)

## Halogenocyanamides from cyclic imines

C

99. cf. Synth. Meth. 6, 552

The direction of ring opening varies with the substituent on the nitrogen. E., also side reactions, s. R. C. Elderfield and M. Green, J. Org. Chem. 17, 431 (1952).

## Addition to Carbon

HalC  $\downarrow$  CC

Without additional reagents

w.a.r.

## 1,2-Dibromides from ethylene derivatives

C:C  $\rightarrow$  CBrCBr

s. 9, 899, 928

## 1,2-Nitrochlorides from ethylene derivatives

C:C  $\rightarrow$  CCIC(NO<sub>2</sub>)

s. 6, 558; at elevated temp. s. R. N. Haszeldine, Soc. 1953, 2075

## 2-Iodoacetals from enol acetates

C:C(OAc)  $\rightarrow$  CIC(OR)<sub>2</sub>100.  $\text{CH}_2=\text{CHOCOCH}_3 \rightarrow [\text{ICH}_2\text{CHCl(OCOCH}_3)] + 2 \text{C}_2\text{H}_5\text{OH} \rightarrow \text{ICH}_2\text{CH(OC}_2\text{H}_5)_2$ 

A mixture of concd. HCl and ICl added below 5° with gentle stirring to a soln. of vinyl acetate in CCl<sub>4</sub> until, after 20 min., ICl is no longer decolorized, the lower organic layer separated rapidly, added to a mixture of 99.5-100% ethanol and CaCl<sub>2</sub>, then allowed to stand 3 days at 10-15°  $\rightarrow$  iodoacetaldehyde diethyl acetal. Y: 82-85%. S. Akiyoshi and K. Okuno, Am. Soc. 74, 5759 (1952).

**1,1,2-Trichlorides from ethylene derivatives  
via chlorohydrins and  $\alpha,\beta$ -ethylenechlorides**

Cl-gas introduced into a stirred mixture of crotonaldehyde and water at ca. 10° for ca. 2 hrs. until the temp. does not rise rapidly when the bath is removed, then refluxed 30 min. with slow stirring to dehydrate the chlorohydrin, the  $\alpha$ -chlorocrotonaldehyde obtained extracted with chloroform (can be isolated in high yields from this extract), treated at 0-10° with chlorine until 1 mole has been added, stirred 1 hr. longer in the ice bath, and dry CO<sub>2</sub> or N<sub>2</sub> bubbled through the soln. at room temp. to remove excess Cl<sub>2</sub> →  $\alpha,\alpha,\beta$ -trichlorobutyraldehyde. Y: 52-53%. G. A. Ropp, W. E. Craig, and V. Raaen, *Org. Synth.* 33, 15 (1953).

**Halogenosteroids from 3,5-cyclosteroids**

s. 9, 635

**Irradiation**
**Bromides from ethylene derivatives  
Free radical additions**

C:C → CHCBr

Trifluoropropene and dry HBr irradiated 18 hrs. at room temp. with UV-light in a sealed silica tube → 3-bromo-1,1,1-trifluoropropane. Y: 97%. No addition takes place in the dark. F. e. s. R. N. Haszeldine, *Soc.* 1952, 2504, 3490; s. a. A. L. Henne and M. Nager, *Am. Soc.* 73, 5527 (1951).

**Ethylene from acetylene derivatives  
via 1,2-dibromides  
Deutero compounds**

A 2:1 mixture of DBr (from D<sub>2</sub>O and PBr<sub>3</sub>) and acetylene-d<sub>2</sub> containing a little air allowed to react at atmospheric pressure, whereby the reaction sets in after a variable induction period or irradiation for a few. min. with UV-light → 1,2-dibromoethane-d<sub>4</sub> (Y: almost 100%) in dioxane added slowly with stirring to Zn-dust and a crystal of NaI, heated gently at first, then gradually to reflux → ethylene-d<sub>4</sub> (Y: 80-86%). L. C. Leitch and A. T. Morse, *Can. J. Chem.* 30, 924 (1952).

**Sodium acetate**

CH<sub>3</sub>COONa

**1,2-Dibromides from ethylene derivatives  
s. 9, 362**

C:C → CBrCBr

*Magnesium oxide**MgO***1,2-Alkoxyhalides from ethylene derivatives**

C:C → C(OR)CHal

604.

Br<sub>2</sub> introduced at 10° by means of a current of dried air into a well-stirred mixture of β,β-dimethylacrylic acid, methanol, and finely powdered MgO over a period of 4.5 hrs., and stirring continued for 15 min. until the mixture becomes colorless → α-bromo-β-methoxyisovaleric acid. Crude Y: 75%. K. Rüfenacht, *Helv.* 35, 762 (1952).

*Aluminum halide**AlHal<sub>3</sub>***Addition of hydrogen halides to acetylene derivatives**

←

605.

Trifluoropropyne and anhydrous HI allowed to react at room temp. in the presence of AlI<sub>3</sub> → 3,3,3-trifluoro-1-iodopropene. Y: 80%. F. e. s. R. N. Haszeldine, *Soc.* 1952, 3490.

*N-Bromosuccinimide and tetraethylammonium bromide*

←

**Reaction between ethylene derivatives and N-bromosuccinimide**

←

606.

Normally, allylic substitution is predominant, but certain structural features and catalysts promote addition to form satd. 1,2-dibromides.—E: A mixture of cyclohexene, N-bromosuccinimide, tetraethylammonium bromide, and chloroform refluxed 20 min. → 1,2-dibromocyclohexane. Y: 74%. F. e. s. E. A. Braude and E. S. Waight, *Soc.* 1952, 1116.

*Sulfuryl chloride**SO<sub>2</sub>Cl<sub>2</sub>***Halogenolactones**

←

**Lactones from halogenocarboxylic acid esters  
with simultaneous replacement of  
carbalkoxy groups by hydrogen  
Trihalides from ethylene derivatives**

607.

SO<sub>2</sub>Cl<sub>2</sub> added dropwise to cooled diethyl allylmalonate, stirred 1 hr. at room temp., refluxed 20 min., excess SO<sub>2</sub>Cl<sub>2</sub> evaporated under re-

duced pressure, the crude ethyl 2-carbethoxy-2,4,5-trichlorovalerate dissolved in glacial acetic acid, HCl added, and refluxed 3 hrs.  $\rightarrow$  2,5-dichloro-4-valerolactone. Y: 90.5%. F. e., also mixed dihalogenovalerolactones by stepwise introduction of halogen, s. R. Gaudry and C. Godin, Am. Soc. 76, 139 (1954).

*Pyridine hydrobromide perbromide*

$C_5H_5N, HBr \cdot Br_2$

**1,2-Dibromo-3-alcohols  
from 2-ethylenealcohols**

C: C  $\rightarrow$  CBrCBr

608.

Pyridine hydrobromide perbromide added portionwise at 12-15° with stirring to a soln. of ( $\pm$ )-1-phenylallyl alcohol in glacial acetic acid, and worked up after 45 min.  $\rightarrow$  ( $\pm$ )-2,3-dibromo-1-phenylpropanol. Y: 47%.—Use of free bromine was unsuccessful. Also with the ( $\pm$ )-compound s. C. L. Arcus and H. E. Strauss, Soc. 1952, 2669.

## Rearrangement

**Hydrogen/Carbon Type**

HalC  $\curvearrowright$  HC

*Sodium acetate*

$CH_3COONa$

**Change in configuration of halogenosteroids**

$\leftarrow$

609.

A soln. of 5 $\alpha$ ,6 $\beta$ -dibromocholestane in glacial acetic acid and chloroform containing Na-acetate kept 8 hrs. at ca. 40° in a closed flask  $\rightarrow$  5 $\beta$ ,6 $\alpha$ -dibromocholestane. Y: 75-6%. C. A. Grob and S. Winstein, Helv. 35, 782 (1952).

## Exchange

**Hydrogen  $\uparrow$**

HalC  $\uparrow$  H

*Without additional reagents*

*w.a.r.*

**Halogenofuranones from acoxyfurans**

$\leftarrow$

610.

Br in  $CCl_4$  added at  $-5$  to  $-10^\circ$  during 8 min. to a stirred soln. of 2-acetoxifuran in  $CCl_4 \rightarrow$  5-bromo-2(5H)-furanone. Y: 81%. Also chloro

derivatives s. N. Elming and N. Clauson-Kaas. *Acta Chem. Scand.* 6, 565 (1952).

### Irradiation

### Directed halogenation

H → Hal

### Photochlorination of aliphatic compounds

11.

Nitriles, esters, acid chlorides, and alkyl acetates, in which the  $\alpha$ -C-atom is generally deactivated for photochlorination, are chlorinated in the *vapor phase*. This procedure gives reproducible yields and reduces polychlorinated products to a minimum. Acids are chlorinated in the liquid phase to avoid dehydrochlorination.—E: Propionitrile chlorinated in the vapor phase with irradiation →  $\beta$ -chloropropionitrile (Y: ca. 65%) and  $\alpha$ -chloropropionitrile (Y: ca. 21%).—Similarly: Propyl acetate →  $\beta$ -chloropropyl acetate (Y: ca. 50%) and  $\gamma$ -chloropropyl acetate (Y: ca. 20%). F. e. s. A. Bruylants et al., *Bull. soc. chim. Belg.* 61, 366 (1952);  $\alpha$ -chlorination of ketones s. 61, 492;  $\alpha$ -bromination of nitriles s. *J. Org. Chem.* 18, 501 (1953).

### Bromination

H → Br

s. 1, 410, 418; s. a. J. C. Bill and D. S. Tarbell, *Org. Synth.* 34, 82 (1954); E. F. M. Stephenson, *Org. Synth.* 34, 100;

1,2-dibromides s. 9, 972; polybromination of steroids s. H. H. Inhoffen, H. Jahnke, and P. Nehring, *B.* 87, 1154 (1954)

### Sodium acetate

$\text{CH}_3\text{COONa}$

### 1,1,1-Trihalides

$\text{CH}_3 \rightarrow \text{CHal}_3$

s. 3, 155; 7, 560; s. a. R. Roth and H. Erlenmeyer, *Helv.* 37, 1064 (1954)

### Potassium iodide

KI

### Iodination

H → I

612.

2,4-Dimethylpyrrole-5-carboxylic acid anilide dissolved in hot alcohol-water, and treated with a soln. of iodine in K-iodide → 3-iodo-2,4-dimethylpyrrole-5-carboxylic acid anilide. Y: 88%. A. Treibs and W. Ott. *A.* 577, 119 (1952).

Potassium iodide/sodium hydroxide

KI/NaOH

613.

An aq. soln. of KI and iodine added dropwise with stirring to a soln. of 3-hydroxy-N-methylmorphinan-6-one in aq. NaOH, and stirring continued for 15 min.  $\rightarrow$  3-hydroxy-2-iodo-N-methylmorphinan-6-one. Y: 85%. R. Grewe, A. Mondon, and E. Nolte, A. 564, 161 (1949); s. a. H. Lettré, H. Fernholz, and E. Hartwig, A. 576, 147 (1952); D. Papa et al., Am. Soc. 75, 1107 (1953); 4-halogeno-5-pyrazolones s. G. Westöö, Acta Chem. Scand. 6, 1499 (1952).

Mercuric oxide

HgO

614.

Yellow mercuric oxide and iodine added alternately in small portions during 1 hr. at 55-65° to a soln. of thianaphthene in benzene  $\rightarrow$  3-iodothianaphthene. Y: 71% based on converted startg. m. R. Gaertner, Am. Soc. 74, 4950 (1952).

Dioxane

 $\leftarrow$ 

Bromination

H  $\rightarrow$  Br

615.

The dioxane-bromine complex is suitable for mild direct halogenation of sensitive ar. compounds.—E: Br in dioxane added dropwise during 2 hrs. with good agitation at 5° to a soln. of aniline in dioxane and aq. KOH  $\rightarrow$  p-bromoaniline. Y: 68%. F. e. s. G. M. Kosolapoff, Am. Soc. 75, 3596 (1953); phenols s. L. A. Yanovskaya, A. P. Terent'ev, and L. J. Belen'kii, Zh. 22, 1594 (1952); C. A. 47, 8032 h; aldehydes and ketones s. Zh. 22, 1598; C. A. 47, 9258e; J. D. Billimoria and N. F. Maclagan, Soc. 1954, 3257.

*N*-Halogenosuccinimide**Halogenation**

6.

**Azulenes.** A soln. of *N*-chlorosuccinimide in dry benzene added to a soln. of 1-chloroazulene in petroleum ether, and the product isolated after 12 hrs. when the test with starch-iodide paper is negative → 1,3-dichloroazulene. Net Y: 82%. F. e. and brominations with *N*-bromosuccinimide s. A. G. Anderson, Jr., J. A. Nelson, and J. J. Tazuma, Am. Soc. 75, 4980 (1953).

Chlorination of pyrimidines s. R. A. West und H. W. Barrett, Am. Soc. 76, 3146 (1954).

*tert*-Butyl hypochlorite $(CH_3)_3C \cdot OCl$ **Ketones from sec. alcohols  
with subsequent chlorination** $CH(OH)CH \rightarrow COCC$ 

617.

*t*-Butyl hypochlorite in  $CCl_4$  added dropwise to a soln. of 5.0 g. cholestan-3 $\beta$ -ol in  $CCl_4$ , and stirred 4 hrs. at room temp.  $\rightarrow$  3.82 g. cholestan-3-one dissolved in glacial acetic acid, treated at 65° with one portion of *t*-butyl hypochlorite, and heated 1 hr. on a steam bath  $\rightarrow$  2-chlorocholestan-3-one (Y: 90%). Also one-step procedure and f. e. s. J. J. Beereboom et al., Am. Soc. 75, 3500 (1953).

**Oxidation-chlorination** **$\alpha$ -Chloroketones from alcohols**

618.

3 $\alpha$ ,17 $\alpha$ -Dihydroxypregnane-11,20-dione dissolved in *tert*-butanol by warming, water and HCl added at 26°, then *tert*-butyl hypochlorite added at 7-10°, and allowed to stand 6 hrs. in the dark  $\rightarrow$  4-chloro-17 $\alpha$ -hydroxypregnane-3,11,20-trione. Y: 72-96.1%. F. e., also chlorination without oxidation, s. R. H. Levin et al., Am. Soc. 76, 546 (1954); other reagents s. Am. Soc. 76, 3179 (1954).

Potassium hypobromite

KOB $\cdot$ **Bromoacetylenes**C $\equiv$ CH  $\rightarrow$  C $\equiv$ CBr

s. 4, 494; s. a. J. D. Billimoria, Soc. 1953, 2626

Via intermediates

v.i.

**5-Bromo-2,3-dihydropyrans**H  $\rightarrow$  Br

19.

Br added at  $-50^\circ$  to an ethereal soln. of 64 g. 2-methoxymethyl-2,3-dihydropyran, the cooling mixture removed, diethylaniline added during 5 min., and refluxed 5 hrs.  $\rightarrow$  69 g. 2-methoxymethyl-5-bromo-2,3-dihydropyran. R. Paul and S. Tchelitcheff, Bl. 1952, 808.

**Oxygen  $\uparrow$** HalC $\uparrow$ O

Without additional reagents

w.a.r.

**Halides from alcohols**OH  $\rightarrow$  Hal

s. 9, 108

**1,1-Alkoxyhalides from acetals**C(OR) $_2$   $\rightarrow$  C(OR)Hal

20.

Dry HBr passed over the surface of a soln. of 3 $\alpha$ -acetoxy-21,21-dimethoxypregnane-11,20-dione in chloroform at  $0^\circ$  for 30 min., and kept 4 additional hrs. at  $0^\circ$   $\rightarrow$  3 $\alpha$ -acetoxy-21-bromo-21-methoxy-17 $\alpha$ -pregnane-11,20-dione. Y: ca. 50%. V. R. Mattox, Am. Soc. 74, 4340 (1952).

**Acetobromosugars with liquid hydrogen bromide**OAc  $\rightarrow$  Br

21.

HBr condensed over  $\beta$ -pentaacetyl-h-galactose, and warmed 15-20 min. at room temp. in a sealed tube until dissolved  $\rightarrow$   $\beta$ -acetobromo-h-galactose. Crude Y: 87%. H. H. Schlubach and E. Wagenitz, H. 213, 87 (1932); s. a. G. A. Howard, B. Lythgoe, and A. R. Todd, Soc. 1947, 1052; F. Weygand and F. Wirth, B. 85, 1000 (1952).

**Dibromides from cyclic ethers**

s. 8, 607; s. a. J. Org. Chem. 19, 1449 (1954)

*Alkali halides***Halides from  
p-toluenesulfonic acid esters**

OTs → Hal

622.

Methyl p-toluenesulfonate, KI, and water heated gradually in an oil bath with distillation → methyl iodide. Y: 94.4%.—Reaction takes place also with sulfonates of sec. hydroxyl groups. F. e. s. F. Drahowzal and D. Klamann, M. 82, 970 (1951).

*Sodium bromide*

NaBr

**Replacement of hydroxyl by bromine  
via p-toluenesulfonic acid esters**

623.

10% excess tosyl chloride added with ice-cooling and occasional swirling during 25 min. to a soln. of 368 g. 1,1-di(hydroxymethyl)cyclohexane in dry pyridine, and allowed to stand overnight at room temp. → 1,1-di(tosyloxymethyl)cyclohexane (Y: 67%; on a smaller scale, nearly 100%) heated 3 hrs. with 20% excess NaBr in diethylene glycol at 150-170° with vigorous stirring → 1,1-di(bromomethyl)cyclohexane (Y: 79%).—A one-step procedure with PBr<sub>3</sub> gave only 27% yield. E. R. Buchman, D. H. Deutsch, and G. I. Fujimoto, Am. Soc. 75, 6228 (1953).

*Sodium iodide*

NaI

**Iodides from p-toluenesulfonic acid esters**

s. 2, 121; in diethyl ketone s. S. W. Pelletier and W. A. Jacobs, Am. Soc. 74, 4218 (1952)

624. The replacement of *sec. tosyloxy groups* in open-chain polyhydroxy compounds occurs under conditions comparable with those necessary to replace many prim. tosyloxy groups. The ease of the reaction is dependent on steric factors and is greatly diminished when the tosyl group is attached to a C-atom which is a member of a ring. E. s. N. K. Matheson and S. J. Angyal, Soc. 1952, 1133.

Triethylamine/phosphorus oxychloride

 $(C_2H_5)_3N/POCl_3$ 

Replacement of hydroxyl by chlorine  
Exchange of substituents of amines

←

25.

A mixture of monopotassium urate,  $POCl_3$

and a limited amount of triethylamine refluxed 4.5 hrs., excess  $POCl_3$  removed on a steam bath under reduced pressure, the remaining sirup poured on ice, allowed to stand 3 hrs. at room temp., refrigerated overnight to complete precipitation, and filtered  $\rightarrow$  8-chloroxanthine. Y: 85.5%.

and excess triethylamine refluxed 13 hrs., excess  $POCl_3$  removed under reduced pressure, the residue poured slowly with vigorous stirring on ice, kept 0.5 hr. at  $0^\circ$ , and filtered  $\rightarrow$  2,8-dichloro-6-diethylaminopurine. 2.1 g. from 5.0 g.

F. e. s. R. K. Robins and B. E. Christensen, Am. Soc. 74, 3624 (1952).

Pyridine/thionyl chloride

 $C_5H_5N/SOCl_2$ 

Halogenoketones from hydroxyketones

OH  $\rightarrow$ 

26.

$SOCl_2$  in benzene added slowly at  $0^\circ$  to a soln. of  $\alpha$ -hydroxy- $\alpha,\alpha$ -diphenylacetone (prepn. s. 743) and pyridine in benzene, and warmed 3 hrs. with stirring at  $50-60^\circ \rightarrow \alpha$ -chloro- $\alpha,\alpha$ -diphenylacetone (startg. m. f. 314). Y: 83.3%. C. L. Stevens and A. E. Sherr, J. Org. Chem. 17, 1228 (1952).

Carboxylic acid chlorides  
from carboxylic acids

COOH  $\rightarrow$  COCl

s. 1, 626; s. a. K. Freudenberg and H. H. Hübner, B. 85, 1181 (1952)

**Subst. carboxylic acid amides from  
carboxylic acids via carboxylic acid chlorides**

627.

A soln. of 1 mole  $\beta$ -bromobutyric acid and 1 mole pyridine in anhydrous ether cautiously treated with 1 mole  $\text{SOCl}_2$  in ether, kept 3 days at room temp., any excess pyridine precipitated as the hydrochloride by adding a small volume of ethereal  $\text{HCl}$ , filtered, a soln. of phenothiazine in toluene added to the filtrate, the ether evaporated, and the toluene soln. kept 4 hrs. at  $85^\circ \rightarrow 10$ -( $\beta$ -bromobutyl)phenothiazine. Y: 81%. F. e., also amide formation at higher temp., s. R. Dahlbom and T. Ekstrand, *Acta Chem. Scand.* 6, 1285 (1952).

*Boron chloride* $\text{BCl}_3$ **Cleavage of mixed ethers** $\text{ROR}' \rightarrow \text{RCl}$ 

s. 9, 194

*Acetic anhydride* $(\text{CH}_3\text{CO})_2\text{O}$ **Bromides from ethers** $\text{OR} \rightarrow \text{Br}$ **Longchain  $\alpha,\omega$ -dihalides**

628.

1,18-Di-p-methoxyphenoxyoctadecane refluxed 24 hrs. with a mixture of acetic anhydride and 50%  $\text{HBr}$  (1:1)  $\rightarrow$  octadecamethylene dibromide. Y: 88%. F. e. s. A. W. Nineham, *Soc.* 1953, 2601.

*Acetyl bromide* $\text{CH}_3\text{COBr}$ **Replacement of hydroxyl by bromine** $\text{OH} \rightarrow \text{Br}$ 

629.

A mixture of 2-methyl-9-fluorenol and acetyl bromide refluxed 10 min.  $\rightarrow$  2-methyl-9-bromofluorene. Y: 90%. F. e. s. E. D. Bergmann et al., *Bl.* 1952, 78.

**Acetobrominolysis of carbohydrates**

←

30. Acetates of maltose or of polysaccharides having only  $\alpha$ -1,4-glucopyranosidic linkages produce almost quantitatively acetobromoglucose.—E: Octaacetyl- $\beta$ -maltose allowed to react with HBr-acetic acid-acetyl bromide for 24 hrs.  $\rightarrow$  acetobromoglucose. Y: 82.5%. F. e. s. A. Jeanes, C. A. Wilham, and G. E. Hilbert, *Am. Soc.* **75**, 3667 (1953).

### 4-Thiazolidones from aldehydes

Ethyl  $\omega$ -formylcaproate and thioglycolamide mixed together in xylene, and refluxed with separation of the water formed  $\rightarrow$  ethyl DL-actithiazate. Y: 44%. F. e. s. R. K. Clark, Jr., and J. R. Schenk, *Arch. Biochem. Biophys.* 40, 270 (1952); with p-toluenesulfonic acid s. F. C. Pennington et al., *Am. Soc.* 75, 109 (1953).

### 2,4-Diaminothiazoles via $\alpha$ -cyanosulfonates

A mixture of benzaldehyde, benzenesulfonyl chloride, NaCN, and water allowed to stand 3 hrs. at  $0-5^\circ$  with occasional shaking  $\rightarrow$   $\alpha$ -cyano-benzyl benzenesulfonate (Y: 84%) stirred with thiourea in acetone at room temp. for 15-30 min. until soln. is achieved, and allowed to stand overnight at the same temp.  $\rightarrow$  2,4-diamino-5-phenylthiazole benzenesulfonate (Y: 80%). R. M. Dodson and H. W. Turner, *Am. Soc.* 73, 4517 (1951).

**Reaction of hydrogen sulfide with amines  
in the presence of formaldehyde**  
**Tetrahydro-1,3,5-thiadiazines**

664.

$\text{H}_2\text{S}$  passed through a mixture of ethanol and 40% formaldehyde until 0.5 mole has been absorbed, this soln. added at  $0^\circ$  to a soln. of aniline in ethanol, and kept overnight at the same temp.  $\rightarrow$  3,5-diphenyltetrahydro-1,3,5-thiadiazine. Y: 75%. F. e. and heterocyclics s. D. Collins and J. Graymore, Soc. 1953, 4089.

Sodium/alcohol

NaOR

**Thioethers from acoxy compounds**  
**Cleavage of acetals**

OAc  $\rightarrow$  SR

A soln. of mercaptoacetaldehyde diethylacetal in abs. ethanol added slowly at  $-10^\circ$  to a soln. of Na in abs. ethanol, then a soln. of 2-acetoxy-1-nitropropane in ethanol added dropwise with shaking at the same temp., allowed to stand 1 hr. at  $-10^\circ$  and 10 hrs. at  $20^\circ \rightarrow$  2-(1-nitropropyl) 2-(1,1-diethoxyethyl) sulfide (Y: 89%) treated with 1 N HCl and dioxane, then heated ca. 5 min. with vigorous stirring in a stream of  $\text{CO}_2$  on a steam bath until dissolved  $\rightarrow$  2-(1-nitropropyl) 2-(1-oxoethyl) sulfide (Y: 95%). C. Grob und H. v. Sprecher, Helv. 35, 902 (1952); f. e. s. 35, 885.

Sodium acetate

 $\text{CH}_3\text{COONa}$ **Thiazolidines**

An aq. soln. of DL-penicillamine hydrochloride and Na-acetate added to a hot soln. of methyl  $\alpha$ -phthalimidomalonaldehyde in 95% ethanol, and allowed to stand 12 hrs. at room temp.  $\rightarrow$  methyl 4-carboxy-5,5-dimethyl- $\alpha$ -phthalimido-2-thiazolidineacetate. Y: 81%. F. e. s. J. C. Sheehan and D. A. Johnson, Am. Soc. 76, 158 (1954).

**Pyrrolo[2,1-b]thiazoles**

667.

A soln. of mucochloric acid in 95% ethanol added to a soln. containing penicillamine methyl ester hydrochloride and Na-acetate in water  $\rightarrow$  4-carbomethoxy-5,5-dimethyl-2-thiazolidine- $\alpha,\beta$ -dichloroacrylic acid  $\gamma$ -lactam. Y: 85%. F. e., with lower yields. s. H. H. Wasserman, F. M. Precopio, and Tien-Chuan Liu. *Am. Soc.* 74, 4093 (1952).

**Potassium thiocyanate****Ethylene sulfides from oxido compounds**

s. 8, 662; s. a. C. C. Price and P. F. Kirk. *Am. Soc.* 75, 2396 (1953)

**Pyridine****Acylation of 1,1-dithiols**

668.

3,5,5-Trimethyl-1,1-hexanedithiol added at 25° to acetic anhydride in pyridine, and kept 18 hrs. at the same temp.  $\rightarrow$  3,5,5-trimethyl-1,1-hexanedithiol diacetate. Y: 71%. F. e. s. T. L. Cairns et al.. *Am. Soc.* 74, 3982 (1952).

**Pyridine/phosphorus pentasulfide****Thiolactams from lactams**

s. 9, 574

**Magnesium/ethyl alcohol****Sulfonylacetic acid esters from sulfonic acid anhydrides via sulfonylmaleonic acid esters**

669.

Benzenesulfonic anhydride (prepn. s. 178) in benzene added during 1.3 hrs. to a refluxing soln. of diethyl ethoxymagnesiummalonate (pre-

pared from diethyl malonate, Mg, and ethanol in  $\text{CCl}_4$ , with subsequent addition of benzene and partial removal of solvent by distillation), and heating continued for 2 hrs.  $\rightarrow$  diethyl phenylsulfonylmalonate (Y: 53%) refluxed with 25%  $\text{-H}_2\text{SO}_4$  ca. 3 hrs. until there is no further gas evolution, then for 0.5 hr. more  $\rightarrow$  ethyl phenylsulfonylacetate (Y: 82%). L. Field, Am. Soc. 74, 394 (1952).

**Boron fluoride** $\text{BF}_3$ **Mercaptals** $\text{C}(\text{SR})_2$ 

s. 8, 667; ethylenethioketals s. a. L. F. Fieser, Am. Soc. 76, 1945 (1954)

**Trithioöthocarboxylic acid esters** $\text{C}(\text{SR})_3$ 

Phenyl thiolacetate, thiophenol, and  $\text{BF}_3$  allowed to stand 14 hrs. at room temp.  $\rightarrow$  phenyl trithioöthoacetate. Y: 71%. F. e., with lower yields, s. D. S. Tarbell and A. H. Herz, Am. Soc. 75, 1668 (1953).

**Aluminum chloride** $\text{AlCl}_3$ **Sulfones from sulfonic acid anhydrides** $\text{RSO}_2\text{R}'$ 

$\text{AlCl}_3$  added with stirring at ca.  $30^\circ$  during 0.5 hr. to benzenesulfonic anhydride (prepn. s. 178) in bromobenzene, warmed briefly when it becomes gelatinous until it can be stirred, then stirred 1 hr. without heating and 4 hrs. at  $75\text{--}85^\circ \rightarrow$  phenyl p-bromophenyl sulfone. Y: 74%. F. e. s. L. Field, Am. Soc. 74, 394 (1952); 76, 1222 (1954).

**Ammonium carbonate** $(\text{NH}_4)_2\text{CO}_3$ **4-Thiazolidones from oxo compounds**

A mixture of 3,4-dichlorobenzaldehyde,  $\text{NH}_4$ -carbonate, thioglycolic acid, and benzene refluxed 8 hrs. with separation of the water formed  $\rightarrow$  2-(3,4-dichlorophenyl)-4-thiazolidone. Y: 72.6%. F. e. s. A. R. Surrey and R. A. Cutler, Am. Soc. 76, 578 (1954).

Formic or acetic acid

 $\text{HCOOH}$  or  $\text{CH}_3\text{COOH}$ 

Sulfones from sulfinic acids and alcohols

 $\text{RSO}_2\text{R}'$ 

Alkyl-oxygen fission

673.

1,2,3,4-Tetrahydro-1-naphthol and its derivatives tend to react by alkyl-oxygen fission.—E: A soln. of 1,2,3,4-tetrahydro-1-naphthyl hydrogen phthalate in a little acetone added to a soln. of Na-p-toluenesulfinate in 98%-formic acid, heated 15 min. at  $100^\circ$ , then kept 48 hrs. at  $20^\circ \rightarrow$  1,2,3,4-tetrahydro-1-naphthyl p-tolyl sulfone. Y: 75%. A. G. Davies and A. M. White, Soc. 1952, 3300; in glacial acetic acid s. M. P. Balfe, J. Kenyon, and E. M. Thain, Soc. 1952, 790.

Lead salt

 $\text{Pb}^{++}$ 

Thiolic acid esters  
from carboxylic acid anhydrides

 $\text{RCOSR}'$ 

674.

m-Tolyl lead mercaptide (prepared by adding excess lead acetate in 50%-alcohol to m-thiocresol) dissolved in dry pyridine, acetic anhydride added slowly, and heated 10 min. on a steam bath after the yellow color has disappeared  $\rightarrow$  m-tolyl thiolacetate. Y: 80%.—The preparation from acetyl chloride gave low yields. D. S. Tarbell and A. H. Herz, Am. Soc. 75, 1668 (1953).

Phosphorus pentasulfide

 $\text{P}_2\text{S}_5$ 

Selective replacement of oxygen by sulfur  
in O-heterocyclics

 $\leftarrow$ 

s. 8, 669; s. a. A. Schönberg, M. M. Sidky, and G. Aziz, Am. Soc. 76, 5115 (1954)

Phosphorus pentasulfide/pyridine

 $\text{P}_2\text{S}_5/\text{C}_5\text{H}_5\text{N}$ 

s. Pyridine/phosphorus pentasulfide

*Hydrosulfite***Sulfamic acids from nitro compounds**

675.

5-Nitrouracil stirred with 3 N NaOH, the slurry of the resulting di-Na salt treated with small portions of  $Na_2S_2O_4$  alternately with NaOH in such a way that the soln. remains alkaline all the time and the  $Na_2S_2O_4$  is consumed before more is added, finally the alkaline soln. containing a little unchanged  $Na_2S_2O_4$  warmed to  $50^\circ$  and filtered  $\rightarrow$  5-sulfamino-uracil (startg. m. f. 332, 538). Y: 85-90%. F. G. Fischer, W. P. Neumann, and J. Roch, B. 85, 752 (1952).

*p-Toluenesulfonic acid***1,3-Oxathiolane ring**

676.

A mixture of 2-mercaptoethanol and cyclohexanone distilled azeotropically with benzene in the presence of a little *p*-toluenesulfonic acid  $\rightarrow$  2-pentamethylene-1,3-thioxolane. Y: 70%. E. D. Bergmann, D. Lavie, and S. Pinchas, Am. Soc. 73, 5662 (1951).

**4-Thiazolidones from aldehydes**

s. 9, 662

*Hydrochlorides***Thiazolidines**

s. 1, 469; isolation as  $HgCl_2$  addition compounds s. Zaki El He-weihi, B. 86, 781 (1953)

# Stillbenes from aldehydes via s-trithianes

677.

A soln. of o-chlorobenzaldehyde in ethyl acetate satd. at 2° with dry HCl, then H<sub>2</sub>S passed in for 2 hrs. with continued introduction of HCl → α and β (*cis-cis* and *cis-trans*) o-chlorothiobenzaldehyde trimers (Y: 98.7%) and freshly prepared Cu-powder heated 1 hr. with stirring under N<sub>2</sub> so that the temp. is not higher than 20° above the m. p. of the startg. m. → 2,2'-dichlorostilbene (Y: 78.2%). F. e. s. J. A. Stanfield and L. B. Reynolds, Jr., Am. Soc. 74, 2878 (1952).

Hydrobromic acid/sodium sulfate

HBr/Na<sub>2</sub>SO<sub>4</sub>

## Thiolactolides from lactolides

OR → SR'

678.

6 drops of 30%-HBr in acetic acid and a little Na<sub>2</sub>SO<sub>4</sub> added to a soln. of methyl 3β-methoxy-3α,9α-oxido-11-ketocholanate in ethyl mercaptan, and allowed to stand 12 hrs. at room temp. → methyl 3β-ethylthio-3α,9α-oxido-11-ketocholanate. Y: 73% based on converted startg. m. H. Heymann and L. F. Fieser, Am. Soc. 73, 5252 (1951).

Via intermediates

v.i.

## Thiolic acid esters from carboxylic acids via mixed alkoxyformic acid anhydrides

COOH → COSR

s. 8, 528; s. a. R. L. Barnden et al., Soc. 1953, 3733

## Nitrogen †

SC<sup>†</sup>N

Without additional reagents

w.a.r.

## γ-Ketothioethers from tert. amines

NR<sub>2</sub> → SR

## S-β-Acylethylation

679.

β-Dimethylaminopropiophenone and benzyl mercaptan heated 5-10 min. at 130-135° until evolution of volatile base ceases → 1,5-diphenyl-2-thiapentan-5-one. Y: 87%. F. e. s. N. S. Gill et al., Am. Soc. 74, 4923 (1952).

## Sulfonic acid amides from diazo compounds

680.

Excess piperidine added to a soln. of diphenyldiazomethane in anhydrous ether, then  $\text{SO}_2$  introduced with ice-salt cooling until the red color is discharged  $\rightarrow$  diphenylmethanesulfonic acid piperidide. Y: 70%. F. e., also with  $\text{NH}_3$ , s. H. Kloosterziel, M. H. Deinema, and H. J. Backer, R. 71, 1228 (1952).

## Sodium nitrite

## Replacement of amino by thiocyanato groups

## Replacement of nitro by thiocyanato groups

## with simultaneous formation of azo compounds by coupling

681.

2,4-Dinitroaniline slowly added at  $35^\circ$  to nitrosylsulfuric acid (from  $\text{NaNO}_2$  and concd.  $\text{H}_2\text{SO}_4$ ), stirred 2 hrs., poured on ice, and the mixture then added to aq. K-thiocyanate  $\rightarrow$  2,4-dinitrothiocyanatobenzene. Y: almost 100%.

1-Nitro-2-naphthylamine in ethanol added to aq.  $\text{H}_2\text{SO}_4$ , quickly diazotized with  $\text{NaNO}_2$  in a small amount of water, after 5 min. urea added, the diazonium soln. poured into aq.  $\text{NH}_4$ -thiocyanate, set aside for 5 min., filtered, and added to a soln. of  $\beta$ -naphthol,  $\text{NaOH}$ , and  $\text{Na}_2\text{CO}_3$  in ice-water  $\rightarrow$  2-(2-hydroxy-1-naphthylazo)-1-thiocyanatonaphthalene. Y: almost 100%.

A. Burawoy and C. Turner, Soc. 1953, 959.

## Copper

 $\beta$ -Ketothioethers from  $\alpha$ -diazoketones

682.

Cu-bronze (Naturkupfer C) added at  $70^\circ$  to a soln. of  $\alpha$ -diazoacetophenone and thiophenol in abs. ethanol until no further gas evolution occurs, then stirred 7 hrs. at  $70\text{--}75^\circ \rightarrow \alpha$ -phenylmercaptoacetophenone. Y: 67%. P. Yates, Am. Soc. 74, 5376 (1952).

*Thioacetamide***Sym. thioethers from tert. amines**

683.

A mixture of  $\beta$ -dimethylaminopropiophenone and thioacetamide heated 15 min. at 140-145°  $\rightarrow$  1,7-diphenyl-4-thiaheptane-1,7-dione. Y: 62%. N. S. Gill et al., *Am. Soc.* 74, 4923 (1952).

*Ammonium chloride***Thioethers from amines**

s. 9, 411

*Via intermediates**v.i.***Mercaptans from amines**s. 3, 517; s. a. D. Greenwood and H. A. Stevenson, *Soc.* 1953, 1514**Halogen †***Without additional reagents**w.a.r.***Thioethers from halides**

684.

A mixture of 1.57 g. 2-chloronicotinic acid and 2 cc. thiophenol heated at 140° until a clear soln. results, then 1 hr. at 185-190°  $\rightarrow$  1.58 g. 2-(3-carboxypyridyl) phenyl sulfide.—Considerable decomposition occurs, when the Na-derivative of thiophenol is used; apparently, an acid media is necessary for the reaction. F. e. s. F. G. Mann and J. A. Reid, *Soc.* 1952, 2057.

**Sym. disulfides from halides**

685.

Trifluoroiodomethane and sulfur in an autoclave filled with  $\text{N}_2$  to atmospheric pressure, and heated 30 hrs. at 220° and 24 hrs. at 265°  $\rightarrow$  bis(trifluoromethyl) disulfide. Y: 60%. G. A. R. Brandt, H. J. Emeléus, and R. N. Haszeldine, *Soc.* 1952, 2198.

**Thiolic acid esters  
from carboxylic acid chlorides**

s. 9, 650

and carboxylic acid anhydrides. Ethyl mercaptan treated at room temp. with 20-30% excess n-heptafluorobutyryl chloride, then heated several hrs. at 100° to complete the reaction → ethyl n-thiolheptafluorobutyrate. Y: 90%.—Similarly with trifluoroacetic anhydride → ethyl thioltrifluoroacetate. Y: 84%. F.e.s. M. Hauptschein, C. S. Stokes, and E. A. Nodiff, *Am. Soc.* 74, 4005 (1952); aminothiolic acid esters from carboxylic acid chlorides s. M. Kopp and B. Tchoubar, *Bl.* 1952, 84.

**Thiocyanates from mercaptans**

Cyanogen bromide and 4(5)-methyl-2-mercaptoimidazole thoroughly mixed, then warmed 0.5-1 hr. at 45-55° → 4(5)-methyl-2-thiocyanimidazole. Y: 59%. F. e. s. R. E. Koeppe and J. L. Wood, *Am. Soc.* 75, 4655 (1953).

**Identification of mercaptans  
as saccharin derivatives**

←

Saccharin chloride and a slight excess n-heptyl mercaptan warmed 10 min. on a steam bath until the HCl-evolution ceases → S-n-heptylthio-saccharin. Y: 70%. F. e. s. J. R. Meadow and J. C. Cavagnol, *J. Org. Chem.* 17, 488 (1952).

**S-Alkylation of thiourea derivatives**

←

of thiosemicarbazones s. 9, 554; of other thiourea derivatives s. E. S. Scott and L. F. Audrieth, *J. Org. Chem.* 19, 1231 (1954)

**Isothiouronium salts**

←

s. 9, 589

## Lithium

Li

## Mercaptans from halides

←

## Ethylene derivatives from ethylenesulfides

689.

An ethereal soln. of cyclohexene sulfide added during 0.5 hr. with gentle refluxing to a soln. of n-butyl-Li, prepared from n-butyl bromide and Li in ether, stirring continued for 2 hrs., allowed to stand overnight, then poured on ice-water → 1-butanethiol (Y: 63%) and cyclohexene (Y: 67%).

The reaction of aryllithium reagents and the readily available propylene sulfide constitutes a new method for preparing thiophenols. It serves as an alternative to the reaction of aryl Grignard reagents and sulfur (S<sub>8</sub>), which is awkward due to the insolubility of sulfur in ether, and usually gives very poor yields.—E: Phenyl-Li from bromobenzene and propylene sulfide → thiophenol. Y: 81%. F. e. s. F. G. Bordwell, H. M. Andersen, and B. M. Pitt, Am. Soc. 76, 1082 (1954).

## Sodium hydride

NaH

## Xanthates and trithiocarbonic acid esters from halides

←

690.

A mixture of cholesterol and NaH in dry benzene refluxed 24 hrs. with stirring, with addition of a trace of ethanol to start the reaction if no H<sub>2</sub>-evolution takes place, allowed to cool to room temp., dry CS<sub>2</sub> added, refluxed again 24 hrs. with stirring, cooled to room temp., methyl iodide added, stirring and refluxing continued for 24 hrs. → cholesteryl-S-methyl xanthate Y: 85%. F. e. s. G. L. O'Connor and H. R. Nace, Am. Soc. 74, 5454 (1952); also trithiocarbonic acid esters from mercaptans s. Am. Soc. 75, 2118 (1953).

*Potassium hydroxide*

KOH

**Carboxythioethers from halogenonitriles**

←

0.5 mole aq. KOH, 0.3 mole 1-butanethiol, and 0.3 mole  $\gamma$ -chlorobutyronitrile added consecutively to alcohol, refluxed 1.5 hrs., more aq. KOH added, and refluxing continued for 3 hrs.  $\rightarrow$   $\gamma$ -(butylmercapto)butyric acid. Y: 76%. F. G. Bordwell, H. M. Andersen, and B. M. Pitt, *Am. Soc.* 76, 1082 (1954).

*Potassium carbonate* $\text{K}_2\text{CO}_3$ **Carboxythioethers**

←

Allyl bromide added dropwise to a vigorously stirred suspension of  $\text{K}_2\text{CO}_3$  and thiosalicylic acid in methyl ethyl ketone and acetone, stirring continued 3 hrs. during which reflux temp. is gradually reached, more allyl bromide and water added, refluxing continued for 15 hrs., concentrated under reduced pressure, 15%  $\text{NaOH}$  soln. added, and refluxed 1 hr.  $\rightarrow$  crude S-allylthiosalicylic acid. Y: 93%. D. S. Tarbell and M. A. McCall, *Am. Soc.* 74, 48 (1952).

## Sulfonic acids from iodonium salts

A mixture of diphenyliodonium bromide, Na-sulfite, and water refluxed 1 hr. → Na-benzenesulfonate. Y: 95%. F. e. and reactions s. F. M. Beringer et al., *Am. Soc.* **75**, 2708 (1953).

## Sodium salt

## Alkylthiomethylsilanes

Bromomethyltrimethylsilane added dropwise with stirring during 15 min. to a soln. of Na-n-butylmercaptide in abs. ethanol, then refluxed 2 hrs. → trimethylsilylmethyl n-butyl sulfide. Y: 92.5%. F. e. s. D. C. Noller and H. W. Post, *J. Org. Chem.* **17**, 1393 (1952).

## Xanthates from halides

1,3-Dibromopropane allowed to react with Na-isoamylxanthate in acetone at 20° 1 hr. → crude trimethylenebis(isoamylxanthate). Y: 90%. F. e. s. D. Lefort and G. Hugel, *Bl.* **1952**, 172.

## Bis(triarylthiomethyl) trisulfides

←

An ethereal soln. of trichloromethylsulfenyl chloride added at -12° to an alc. soln. of Na-phenylmercaptide (prepared from phenylmercaptan and Na-ethoxide) → bis(triphenylthiomethyl) trisulfide. Y: 66.5%. F. e. s. H. J. Backer and E. Westerhuis, *R.* **71**, 1071 (1952); f. method s. *R.* **71**, 1082.

Potassium and ammonium salts

 $K^+$  and  $NH_4^+$ **1,3,4-Thiadiazines via  
 $\alpha$ -(dithiocarbazyl)oxo compounds**

697.

A 20% aq. soln. of K-phenyldithiocarbazate added at 5-9° during 30 min. to a well-stirred mixture of 3-chloro-2-butanone and 50%-ethanol  $\rightarrow$  crude 3-(2-phenyldithiocarbazyl)-2-butanone (Y: 92%) added to HCl, and heated to 70° with stirring  $\rightarrow$  5,6-dimethyl-2-mercapto-4-phenyl-1,3,4,4H-thiadiazine (Y: 86%). F. e., also one-step procedure and with  $NH_4$ -salts, s. R. A. Mathes, J. Org. Chem. 17, 877 (1952).

Pyridine

 $C_5H_5N$ **Hydroxythioethers from hydroxymercaptans**SH  $\rightarrow$  SR

698.

A mixture of *trans*-2-hydroxycyclohexanethiol and 1 mole 2,4-dinitrochlorobenzene dissolved in pyridine heated 1 hr. on a steam bath  $\rightarrow$  2,4-dinitrophenyl *trans*-2-hydroxycyclohexyl sulfide. Y: 87%. F. e. s. F. G. Bordwell and H. M. Andersen, Am. Soc. 75, 4959 (1953).

**Thiolic acids from carboxylic acid chlorides**COCl  $\rightarrow$  COSH

s. 1, 491; s. a. C. S. Marvel and E. A. Kraiman, J. Org. Chem. 18, 707 (1953)

Calcium carbonate

 $CaCO_3$ **Thioethers from halides**Hal  $\rightarrow$  SR

699.

A mixture of 4 g. 3 $\alpha$ -acetoxy-11-keto-12,21-dibromo-24,24-diphenyl- $\Delta^{20,22;23}$ -choladiene (prepn. s. 927),  $CaCO_3$ , and ethyl mercaptan shaken 16 hrs. at room temp.  $\rightarrow$  3.9 g. crude 3 $\alpha$ -acetoxy-11-keto-12-bromo-21-

thioethyl-24,24-diphenyl- $\Delta^{20,22;23}$ -choladiene. J. Heer and A. Wettstein, *Helv.* **36**, 891 (1953).

*Phenyllithium***Synthesis of alcohols from oxo compounds**

An ethereal soln. of phenyl-Li added dropwise at 0° to an ethereal soln. of 2-methyl-1-tetrahydro-2'-pyranyloxy-pent-2-en-4-yne, after stirring at 0° for 7 hrs. acetone in ether added during 15 min., the temp. allowed to rise to 20° during 8 hrs., finally refluxed for 10 min. → 2,6-dimethyl-7-tetrahydro-2'-pyranyloxyhept-5-en-3-yn-2-ol. Y: 80%.—Lower yields were obtained with Mg. Also sec. alcohols from aldehydes s. R. Ahmad and B. C. L. Weedon, *Soc.* 1953, 3286.

*Lithium amide***Synthesis of acetylenealcohols from oxo compounds and  $\alpha,\beta$ -ethylenebromides**

2-Bromo-3-diethylamino-1-propene added to a soln. of 2 moles  $LiNH_2$  (from Li in the presence of ferric nitrate) in liq.  $NH_3$ , stirred 4 hrs., a soln. of cycloheptanone in dry ether then added dropwise during 30 min., stirring continued for a further 4 hrs.,  $NH_4Cl$  added, and the  $NH_3$  allowed to evaporate → 1-(3-diethylamino-1-propynyl)-1-cycloheptanol. Y: 72%. Also from acetylene derivatives s. A. M. Islam and R. A. Raphael, *Soc.* 1953, 2247.

**Synthesis of prim. acetylenealcohols from oxido compounds**

An ethereal soln. of 4-(tetrahydro-2-pyranyloxy)-1-butyne added dropwise during 15 min. to a stirred soln. of  $LiNH_2$  (from Li in the presence of ferric nitrate catalyst) in liq.  $NH_3$ , stirring continued 40 min.,

then ethylene oxide added all at once, and stirred 9 hrs. → 6-(tetrahydro-2-pyranyloxy)-3-hexyn-1-ol. Y: 77%. R. A. Raphael and C. M. Roxburgh, *Soc.* 1952, 3875.

*Sodium/liq. ammonia*

Na/NH<sub>3</sub>

### Ethynylalcohols from oxo compounds

CO → C(OH)R

s. 4, 624; s. a. D. Papa, F. J. Villani, and H. F. Ginsberg, *Am. Soc.* 76, 4446 (1954)

*Sodium amide*

NaNH<sub>2</sub>

### Tert. alcohols from ketones

CO → C(OH)R

738.

2-Picoline added during 5 min. to a suspension of NaNH<sub>2</sub> in liq. NH<sub>3</sub>, stirred 15 min., 2-amino-4'-methoxybenzophenone in 2-picoline and dry ether added during 10 min., and stirred 4 hrs. → 1-o-aminophenyl-1-p-methoxyphenyl-2,2'-pyridylethanol. Y: 49.6%. F. e. s. A. J. Nunn and K. Schofield, *Soc.* 1953, 716.

### Ethynylalcohols from oxo compounds

s. 2, 590; s. a. G. W. Stacy and R. A. Mikulec, *Am. Soc.* 76, 524 (1954)

*Potassium carbonate*

K<sub>2</sub>CO<sub>3</sub>

### Diene synthesis with lactones

739.

β-Propiolactone can be used in place of acrylic acid as the dienophile component. K-carbonate, known to aid conversion of the lactone into acrylic acid is used as catalyst.—E: A mixture of β-propiolactone, butadiene, K-carbonate, and hydroquinone heated whereby exothermic reactions take place at ca. 100 and at ca. 200°, the temp. rising finally to 270° for a short time, the reaction completed by heating at 200° for 1.5 hrs. → cyclohexene-4-carboxylic acid. Y: 96%. F. e. s. T. L. Gresham, J. E. Jansen, and F. X. Werber, *Am. Soc.* 76, 609 (1954).

*Sodium cyanide*

NaCN

### α-Cyanosulfonates from aldehydes

CHO → CH(CN)OSO<sub>2</sub>R

s. 9, 663

Potassium cyanide

KCN

Subst. homophthalic acids from phthalides  
via *o*-carboxyphenylacetonitriles and  
pyrrolo(2',3':3,4)isocoumarins

←

40.

Na-acetate added to a soln. of 6,7-dimethoxy-3-(4-methoxyphenyl)-phthalide in boiling 2-methoxyethanol, KCN in water added during 2 min. below the surface of the soln. heated in a boiling water bath, and heating continued 10 min. with gentle stirring every min. →  $\alpha$ -(2-carboxy-3,4-dimethoxyphenyl)- $\beta$ -(*p*-methoxybenzoyl)propionitrile (crude Y: 70%) dissolved in boiling glacial acetic acid, the source of heat removed, concd. HCl added, and heated 10 min. on a water bath → 7,8-dimethoxy-5'-(*p*-methoxyphenyl)pyrrolo(2',3':3,4)isocoumarin (3.4 g. from 5 g. phthalide), 5 g. heated 1.5 hrs. on a water bath with 10%-NaOH, then refluxed ca. 30 min. until  $\text{NH}_3$ -evolution ceases → 4.9 g.  $\alpha$ -(2-carboxy-3,4-dimethoxyphenyl)- $\beta$ -(*p*-methoxybenzoyl)propionic acid. F. e. s. A. S. Bailey and R. S. Staunton, *Soc.* 1952, 2153.

Magnesium

Mg

Asym. synthesis by Grignard reaction

←

41.

An ethereal soln. of (-)menthyl phenylglyoxylate (prepn. s. 359) added dropwise to ice-cooled ethereal methyl-MgI, allowed to stand 1 hr. at room temp., then gently refluxed for 30 min., and the crude product hydrolyzed by refluxing with KOH in methanol-water for 5 hrs. → (-)atrolactic acid. Y: 92%; optical Y: 25%. F. e. and theory s. V. Prelog et al., *Helv.* 36, 320, 308, 325 (1953); s. a. C. F. Huebner and H. L. Troxell, *J. Org. Chem.* 18, 736 (1953).

**Tert. alcohols from ketones**

s. 9, 981

**Alkoxyacetylenealcohols**s. 5, 474; s. a. G. E. Arth et al., *Am. Soc.* 76, 1715 (1954); H. Kappeler et al., *Helv.* 37, 957 (1954)**Sec. alcohols from oxido compounds**s. 5, 476; s. a. P. Cagniant, *Bl.* 1952, 970**Amino-tert-alcohols****from aminocarboxylic acid esters****Use of Trilon B in Grignard reactions**

742.

Methyl 13-dimethylaminotetradecanoate allowed to react with methyl-MgI, then an aq. soln. of Trilon B (Na-ethylenediamine-N,N,N',N'-tetraacetate) added at 40°  $\rightarrow$  14-dimethylamino-2-methyl-2-pentadecanol. Y: 78-85%.—The use of  $\text{NH}_4\text{Cl}$  for the removal of magnesium gives greatly lowered yields. J. Métivier, *Bl.* 1952, 965.

**Synthesis of hydroxyketones****from ketocarboxylic acid esters****Blocking of keto groups****by formation of acetals**

743.

A mixture of ethyl pyruvate, ethyl orthoformate, abs. ethanol, and 5 drops concd.  $\text{H}_2\text{SO}_4$  allowed to stand 24 hrs., then refluxed 8 hrs.  $\rightarrow$  ethyl  $\alpha,\alpha$ -diethoxypropionate (Y: 79%) added slowly with stirring and cooling during 2 hrs. to ethereal phenyl-MgBr, refluxed 2 hrs., and hydrolyzed with satd.  $\text{NH}_4\text{Cl}$  soln.  $\rightarrow$  1,1-diphenyl-2,2-diethoxy-1-propanol (Y: 61.5%) refluxed 3 hrs. with HCl in ethanol-water  $\rightarrow$   $\alpha$ -hydroxy- $\alpha,\alpha$ -diphenylacetone (Y: 98%) (startg. m. f. 626). C. L. Stevens and A. E. Sherr, *J. Org. Chem.* 17, 1228 (1952).

**Synthesis of long-chain  $\alpha,\omega$ -dicarboxylic acids**  
**Carboxylic acids from**  
**dicarboxylic acid imides**  
**via  $\alpha$ -hydroxylactams and ketocarboxylic acids**

44.

$\alpha,\omega$ -Decyl-di(MgBr) from  $\alpha,\omega$ -dibromodecane and Mg in abs. ether allowed to react with N-methylglutarimide  $\rightarrow$  1,10-bis-(1'-methyl-2'-hydroxy-6'-oxo-2'-piperidyl)-n-decane (Y: 26%) allowed to react with 100%-hydrazine hydrate in a soln. of Na in ethyleneglycol  $\rightarrow$  octadecane-1,18-dicarboxylic acid. Y: 25%. F. e. s. R. Lukeš and K. Bláha. Collection Czechoslov. Chem. Commun. 18, 804 (1953).

**Synthesis of diols from lactones**

### Calcium carbide/nickel acetylacetonate

←

s. *Nickel acetylacetonate/calcium carbide*

## Magnesium

Mg

Addition of Grignard reagents  
to carbon-carbon double bonds

C:C → CHCR

770.

A soln. of ethyl 2-methylbenzylmalonate in ether added dropwise during 1 hr. at  $0-5^\circ$  to a well-stirred soln. of o-tolyl-MgBr in ether, and stirring continued 2 hrs. at room temp. → ethyl 2,2'-dimethylbenzylmalonate. Y: 72%. F. e. s. M. S. Newman and M. Wolf, Am. Soc. 74, 3225 (1952).

**Synthesis of  $\beta,\gamma$ -ethylenecarboxylic acids  
from  $\alpha$ -allenecarboxylic acids  
and of carboxylic acids  
from  $\alpha,\beta$ -ethylenecarboxylic acids**

771.

A soln. of 1,2-heptadiene-3-carboxylic acid in dry ether added with shaking to 2.5 moles ethyl-MgBr in ether, the resulting soln. poured on Dry Ice, and upon coming to room temp. hydrolyzed with satd.  $\text{NH}_4\text{Cl}$ -soln. → 2-butyl-3-ethyl-3-butenic acid. Y: 85%. J. H. Wotiz and J. S. Matthews, Am. Soc. 74, 2559 (1952); carboxylic acids from  $\alpha,\beta$ -ethylenecarboxylic acids, in lower yields, s. Am. Soc. 75, 6342 (1953).

**Hydrolytic ring opening of isocyclics  
with simultaneous formation of  
ethylene derivatives from sulfonic acid esters**

←

772.

Diethylamine acetate

**Benzene ring by trimerization**

775.

Butinone heated 10 min. on a water bath with diethylamine acetate → sym-triacetylbenzene. Y: 34%. F. Wille and F. Knörr, B. 85, 841 (1952).

Acetic anhydride

 $(\text{CH}_3\text{CO})_2\text{O}$ **Nitriles from ethylene derivatives** $\text{C}:\text{C} \rightarrow \text{CHC}(\text{CN})$ 

776.

An aq. soln. of 2 moles KCN added dropwise with stirring to a soln. of 1 mole 2-vinylpyridine and 2 moles acetic anhydride at a rate to maintain gentle boiling, then heated 16 hrs. with stirring on a steam bath → β-(2-pyridyl)propionitrile. Y: 67%. V. Boekelheide et al., Am. Soc. 75, 3243 (1953).

Benzoyl peroxide

 $(\text{C}_6\text{H}_5\text{COO})_2$ **Free radical reactions****Synthesis of ketones****from aldehydes and ethylene derivatives**

s. 8, 745; s. a. Org. Synth. 34, 51 (1954); Ng. Ph. Buu-Hoï, R. 72, 84 (1953)

Sulfuric acid

 $\text{H}_2\text{SO}_4$ **Alkylation with ethylene derivatives****Isocyclics**

s. 5, 506, s. a. W. L. Lenneman, R. D. Hites, and V. I. Komarewsky, J. Org. Chem. 19, 463 (1954)

Chromium oxide/alumina

 $\text{Cr}_2\text{O}_3/\text{Al}_2\text{O}_3$ **Pyridine ring from dienes**

777.

Benzonitrile and butadiene passed at 400° during 4 sec. over a 4%  $\text{Cr}_2\text{O}_3/\text{Al}_2\text{O}_3$  catalyst → 2-phenylpyridine. Y: 60%. G. J. Janz, W. J. G. McCulloch, and E. F. Timpane, Ind. Eng. Chem. 45, 1343 (1953).

Nickel acetylacetonate/calcium carbide

Subst. cycloöctatetraenes  
by copolymerization

←  
○

78.

A mixture of 1-pentyne, dry tetrahydrofuran, Ni-acetylacetonate, and powdered Ca-carbide heated 7-12 hrs. at 70-90° and an acetylene pressure of 300-150 p. s. i. → n-propylcycloöctatetraene. Y: 25%. F. e., with lower yields, s. A. C. Cope and H. C. Campbell, Am. Soc. 74, 179 (1952).

### Pyridine ring from enamines

07.

Ethyl  $\beta$ -aminocrotonate added to a soln. of diethyl ethoxymethylene-oxalacetate in anhydrous ether  $\rightarrow$  triethyl 6-methyl-2,3,5-pyridinetri-carboxylate. Y: 86%. F. e. s. E. M. Bottorff et al., Am. Soc. 73, 4380 (1951); s. a. R. G. Jones, Am. Soc. 73, 5610 (1951).

### 4-Piperidones

08.

n-Propylamine added dropwise to a mixture of diethyl acetonedicarboxylate and benzaldehyde  $\rightarrow$  diethyl 1-propyl-2,6-diphenyl-4-piper-idone-3,5-dicarboxylate. Y: 82.5%. F. e. s. P. Soni and G. S. Sidhu, J. Indian Chem. Soc. 28, 405 (1951).

## 4-Hydroxycarbostyrils

809.

Equimolecular amounts of diethyl *n*-butylmalonate and *p*-anisidine refluxed 8 hrs. with Dowtherm A  $\rightarrow$  3-*n*-butyl-4-hydroxy-6-methoxycarbostyril. Y: 91%. R. R. Holmes et al., Am. Soc. 76, 2400 (1954); method s. R. H. Baker, G. R. Lapin, and B. Riegel, Am. Soc. 68, 1284 (1946).

Lithium

Li

## Ketones form carboxylic acids

COOH  $\rightarrow$  COR

810.

Ethereal methyl-Li, prepared from methyl iodide and Li, added dropwise during 3.5 hrs. with vigorous stirring at 15° under N<sub>2</sub> to 1-hydroxycyclohexane-1-carboxylic acid in ether  $\rightarrow$  1-acetylcyclohexanol. Y: 73%.—By other procedures, a partial conversion of the carboxyl group to a tert. alcohol occurs. J. D. Billimoria and N. F. MacLagan, Soc. 1951, 3067; f. e. s. C. Tegner, Acta Chem. Scand. 6, 782 (1952); H. Kappeler et al., Helv. 37, 957 (1954).

Sodium hydride

NaH

 $\beta$ -Ketocarboxylic acid estersCOCH<sub>2</sub>COOR

## from carboxylic acid esters

## Mixed ester condensation

s. 6, 738; 7, 434; fluorine-containing compounds s. E. T. McBee et al., Am. Soc. 75, 3152 (1953)

Sodium hydroxide

NaOH

## Subst. phthalides

## from o-aldehydcarboxylic acids

811.

Methanol added to a suspension of 16 g. p-methoxyacetophenone and 21 g. opianic acid in 10% NaOH until a homogeneous soln. is obtained. then kept 24 hrs. at room temp.  $\rightarrow$  29.5 g. 6,7-dimethoxy-3-(4-methoxyphenacyl)phthalide. F. e. s. A. S. Bailey and R. S. Staunton, *Soc.* 1952, 2153.

#### Potassium hydroxide

KOH

#### $\alpha,\beta$ -Ethylenenitriles from aldehydes

CHO  $\rightarrow$  CH:C:CN

s. 7, 271; also with Na-ethoxide, pyridine, and other condensing agents s. A. Schonne, E. Braye, and A. Bruylants, *Bl. Soc. chim. Belg.* 62, 155 (1953)

#### Condensed cyclohexenolones

○

12.

Acenaphthenequinone and benzyl methyl ketone in methanolic KOH stirred 3 hrs. at room temp.  $\rightarrow$  condensed cyclohexenolone. Y: 78%. F. e. s. C. F. H. Allen and J. A. VanAllan, *J. Org. Chem.* 17, 845 (1952).

#### Sodium/alcohol

NaOR

#### Oxalic ester synthesis

H  $\rightarrow$  COCOR

s. 3, 620; 5-tetrazolylpyruvates s. C. R. Jacobsen and E. D. Amstutz, *J. Org. Chem.* 18, 1183 (1953)

s. 4, 703; s. a. *Org. Synth.* 34, 13 (1954)

#### $\alpha$ -Cyanoketones from nitriles

CHCN  $\rightarrow$  C(CN)COR

s. 2, 645; s. a. W. Logemann, L. Almirante, and L. Caprio, *B.* 87, 435 (1954)

#### 4-Pyrones

○

13.

A soln. of Na in abs. ethanol added to a mixture of acetone and ethyl oxalate. when the soln. becomes turbid more ethyl oxalate and Na-ethoxide soln. added, the crude chelidonic ester isolated after ca. 10 min. and hydrolyzed by heating 20 hrs. with concd. HCl on a steam bath  $\rightarrow$  chelidonic acid. Y: 72%. R. F. Toomey and E. R. Riegel, *J. Org. Chem.* 17, 1492 (1952).

## Coumarin ring

814.

A mixture of o-hydroxyacetophenone, ethyl cyanoacetate, and some Na-ethoxide in abs. ethanol refluxed 2 hrs. after the appearance of needle-shaped crystals  $\rightarrow$  3-cyano-4-methylcoumarin (startg. m. f. 279). Y: 79%.—Na-ethoxide catalyzes the aldol condensation better than pyridine and piperidine. C. H. Schroeder and K. P. Link, Am. Soc. 75, 1886 (1953).

## Pyridine ring synthesis

815.

A mixture of isobutoxymethylenephenylnitrile, cyanoacetamide, and a soln. of Na in abs. ethanol refluxed 6 hrs. in a slow stream of N<sub>2</sub>  $\rightarrow$  2-amino-5-cyano-6-hydroxy-3-phenylpyridine. Y: 81%. F. e. s. B. H. Chase and J. Walker, Soc. 1953, 3548.

Sodium methoxide

NaOCH<sub>3</sub>

$\beta$ -Ketoacetals from ketones  
via  $\alpha$ -hydroxymethyleneketones

COCH<sub>3</sub>  $\rightarrow$  COCH<sub>2</sub>CH(OR)<sub>2</sub>

816.

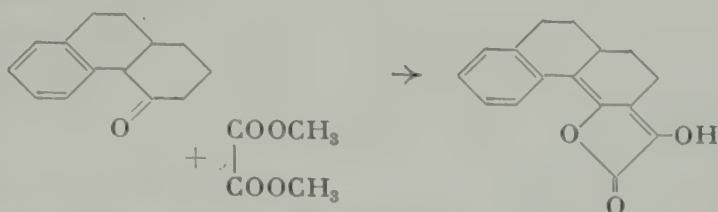

A mixture of isobutyl methyl ketone and methyl formate added with stirring to a slurry of Na-methoxide in abs. ether at a rate to maintain gentle reflux, stirring continued 1 hr., most of the ether removed without stirring under reduced pressure, methanol added to the solid Na-hydroxymethyleneketone followed by a soln. of anhydrous HCl in methanol, stirring continued 1-2 hrs. at 20°, and made just alkaline to litmus with satd. methanolic KOH  $\rightarrow$  1,1-dimethoxy-5-methyl-3-hexanone. Y: 69.4%. F. e. s. E. E. Royals and K. C. Brannock, Am. Soc. 75, 2050 (1953).

## Dienollactones

○

17.

A mixture of methyl oxalate, Na-methoxide, and benzene refluxed 10 min. under N<sub>2</sub>, a soln. of 2 g. *trans*-1,2,3,4,9,10,11,12-octahydro-4-ketophenanthrene in benzene added, stirred 5 hrs. at room temp. under N<sub>2</sub>, the crude solid Na-salt thus obtained suspended in dioxane, and HCl added to just neutral reaction → 1.8 g. lactone. F. e. s. D. Ginsburg and R. Pappo, Soc. 1953, 1524.

## 2,3-Pyrrolidiones

18.

Methyl oxalate followed by a soln. of methyl β-benzylaminopropionate in anhydrous ether added to a well-stirred suspension of Na-methoxide in ether, and refluxed 0.5 hr. with stirring → 4-carbomethoxy-1-benzyl-2,3-dioxopyrrolidine. Y: 75%. F. e. s. P. L. Southwick and R. T. Crouch, Am. Soc. 75, 3413 (1953).

Potassium *tert*-butoxide

KOR

Subst. unsatd. succinic acid monoesters

←

Stobbe condensation

s. 2, 647; s. a. G. Büchi and J. J. Pappas, Am. Soc. 76, 2963 (1954); G. N. Walker, Am. Soc. 75, 3387 (1953)

*n*-ButyllithiumC<sub>4</sub>H<sub>9</sub>Li

Synthesis of sym. ketones  
with carbon dioxide

Metalation of thiophenes

19.

Thiophene allowed to react with *n*-butyl-Li in ether under N<sub>2</sub>, gently refluxed for an additional 15 min., then CO<sub>2</sub> in place of N<sub>2</sub> bubbled into the soln. for 10 hrs. until the test for organo-Li compound is negative → di-2-thienyl ketone. Y: 67%. N. M. Löfgren and C. Tegner, Acta Chem. Scand. 6, 1020 (1952).

*Sodium/liq. ammonia* $\text{Na}/\text{NH}_3$ **Synthesis of acetylene derivatives** $\text{CH} \rightarrow \text{CR}$ 

Mono-Na-diacetylide prepared from diacetylene and Na in liq.  $\text{NH}_3$ , allowed to react with diethyl sulfate  $\rightarrow$  1,3-hexadiyne. Y: almost 100%. F. e. s. T. Herbertz, B. 85, 475 (1952).

*Sodium amide* $\text{NaNH}_2$ **Alkylation of nitriles  
with p-toluenesulfonic acid esters**

A soln. of diphenylacetoneitrile in dry toluene added to a slurry of  $\text{NaNH}_2$  in toluene, heated with stirring to  $106^\circ$  under  $\text{N}_2$ , heating and stirring continued until 95% or more of the theoretical amount of  $\text{NH}_3$  is evolved, cooled to  $65^\circ$ , 1-chloro-2-propyl p-toluenesulfonate added slowly with stirring below  $80^\circ$ , and refluxed 18 hrs. with stirring  $\rightarrow$  4-chloro-2,2-diphenyl-3-methylbutanenitrile. Y: 65%.—The sec. tosyl ester group is more reactive than the prim. chlorine atom. M. Sletzin-ger, E. M. Chamberlin, and M. Tishler, Am. Soc. 74, 5619 (1952).

**Synthesis of dihydrofurans  
from  $\gamma$ -lactones**

←

Isobutyl methyl ketone added dropwise during 20-30 min. to  $\text{NaNH}_2$  in ether, agitated for an additional 10 min.,  $\gamma$ -valerolactone in anhydrous ether added during 30 min., and refluxed 8 hrs. on a water bath  $\rightarrow$  5-methyl-2-(2'-hydroxy-4'-methyl-1'-pentenyl)-4,5-dihydrofuran. Y: 59.3%. F. e., with lower yields, s. G. W. Cannon, J. J. Casler, Jr., and W. A. Gaines, J. Org. Chem. 17, 1245 (1952).

Sodium carbonate

Na<sub>2</sub>CO<sub>3</sub>

### 3,4-Dihydroxy-2-imino-2,5-dihydrofurans from aldehydes

○

823.

Glyoxal hydrogen sulfite dihydrate and a soln. of benzaldehyde in dioxane added with stirring in a N<sub>2</sub>-stream to a soln. of KCN in aq. 2 N Na-carbonate, after 30 min. adjusted with glacial acetic acid to pH 6, and stirring continued for 3 hrs. → 4-phenyl-2-hydroxytetronimide. Y: 93%. F. e. s. H. Dahn et al., *Helv.* 37, 1309 (1954).

Sodium cyanide

NaCN

### α-prim-Aminonitriles from aldehydes Synthesis with addition of 1 C-atom

824.

β-Methylthiopropionaldehyde added dropwise with stirring during 30 min. at 15-20° to a mixture of NH<sub>4</sub>Cl, NaCN, concd. aq. NH<sub>3</sub>, and alcohol satd. with NH<sub>3</sub>, stirring continued overnight → α-amino-γ-methylthiobutyronitrile. Y: 95.5%. D. O. Holland and J. H. C. Naylor, *Soc.* 1952, 3403.

Potassium cyanide

KCN

### Nitriles from p-toluenesulfonic acid esters Partial tosylation

←

825.

A soln. of acetone quinalcohol in abs. pyridine mixed at -40° in a closed apparatus (s. original paper) with a soln. of p-toluenesulfonyl chloride in chloroform, and allowed to stand 3 days at -20° → crude monotosyl derivative (Y: ca. 85%) dissolved in alcohol, treated with KCN, and kept 16 hrs. at 40° with occasional shaking → isopropylidene-homoquinonitrile (Y: ca. 75%). Overall Y: 64%. F. e. for the second step s. R. Grewe and E. Nolte, *A.* 575, 1 (1952).

**$\alpha$ -Aminonitriles from oxo compounds**CO  $\rightarrow$  C(CN)N

s. 6, 752; 7, 777; bis-( $\alpha$ -aminonitriles) s. H. Zahn and H. Wilhelm, A. 579, 1 (1953)

**Hydantoins from oxo compounds**

s. 1, 568; 5-pyridylhydantoins s. H. R. Henze and M. B. Knowles, J. Org. Chem. 19, 1127 (1954)

Potassium cyanide/hydrochloric acid

KCN/HCl

**Carboxylactones from ketocarboxylic acids via cyanolactones**

826.

Cold aq. levulinic acid added with stirring during 30 min. to cold aq. KCN, stirred 24 hrs. at 0°, acidified by slow addition of concd. HCl, stirred at 0° for another 24 hrs., then heated 10 min. at 100°  $\rightarrow$  DL- $\gamma$ -cyano- $\gamma$ -valerolactone (Y: 55.8%) refluxed 21 hrs. with 20.8% HCl  $\rightarrow$  DL- $\gamma$ -carboxy- $\gamma$ -valerolactone (Y: 94%). F. e. s. R. Adams and F. Hauserman, Am. Soc. 74, 694 (1952).

Sodium salt

Na<sup>+</sup>**Kostanecki-Robinson reaction****Coumarin ring from o-hydroxyketones**

827.

A mixture of 1 mole 1-butyryl-2-naphthol, 6.5 moles propionic anhydride, and 4.5 moles Na-propionate heated 6 hrs. in an oil bath at 160°, cooled, then boiled 2 hrs. with water to decompose the excess acid anhydride  $\rightarrow$  3-methyl-4-propylnaphthocoumarin. Y: 88%.—Depending on the startg. m., coumarins or chromones, or mixtures thereof are obtained. F. e. s. A. B. Sen and T. N. Kakaji, J. Indian Chem. Soc. 29, 127, 950 (1952).

## Triton B

Cinnamylidenemalonic acids  
from aldehydes

828.

Methanolic 35%-benzyltrimethylammonium hydroxide added to a mixture of 3,4,5-trimethoxybenzaldehyde, ethyl ethylidenemalonate, and abs. ethanol, allowed to stand 24-48 hrs. at room temp., and the ester hydrolyzed by addition of water and refluxing 30-60 min.  $\rightarrow$  3,4,5-trimethoxycinnamylidenemalonic acid. Y: 86%. F. e. s. P. D. Gardner et al., Am. Soc. 74, 5527 (1952).

## Methylamine

 $\beta,\gamma$ -Nitroethylene derivatives  
from ketones

829.

Anhydrous liq. methylamine added at 5° to a mixture of cyclohexanone and nitromethane, and kept 17 days at 8-10°  $\rightarrow$  1-nitromethyl-1-cyclohexene. Y: 48%. With piperidine, only 26% yield was obtained. F. e. s. D. V. Nightingale, F. B. Erickson, and J. M. Shackelford, J. Org. Chem. 17, 1005 (1952).

## Aniline

 $\alpha,\beta$ -Nitroethylene derivatives  
from aldehydes

830.

A mixture of 4-hydroxybenzaldehyde, nitromethane, and aniline heated 1 hr. on a water bath  $\rightarrow$  4-hydroxy- $\beta$ -nitrostyrene. Y: 79%. F. e. and methods s. O. Schales and H. A. Graefe, Am. Soc. 74, 4486 (1952).

**$\alpha,\beta$ -Ethylene- $\alpha$ -cyanocarboxylic acid esters**  $\text{CHO} \rightarrow \text{CH:C(CN)COOR}$   
**from aldehydes**

s. 7, 781; s. a. J. Harley-Mason and A. H. Jackson, Soc. 1954, 1165

**$\beta$ -Subst. glutaric acids from aldehydes** ←  
**via arylmethylene-bis-acetoacetates**

s. 6, 759; s. a. Am. Soc. 76, 2731 (1954)

**Eneheterocyclics** ←

s. 9, 336

**Tetrahydrothio-4-pyrones** ○

1 mole piperidine added dropwise at  $-15$  to  $-10^\circ$  to a soln. of diethyl acetonedicarboxylate in ethanol, then acetaldehyde in ethanol added. and  $\text{H}_2\text{S}$  introduced at the same temp. for 25 min.  $\rightarrow$  2,6-dimethyl-3,5-dicarbethoxytetrahydrothio-4-pyrone. Y: 36.7%. V. Horák and M. Černý. Collection Czechoslov. Chem. Commun. 18, 379 (1953).

**Pyridine**

$\text{C}_5\text{H}_5\text{N}$

**Ketones from carboxylic acids**

$\text{COOH} \rightarrow \text{COR}$

A mixture of  $\alpha$ -2-(6-methyl-3-pyridazonyl)propionic acid, acetic anhydride, and pyridine refluxed 2 hrs., during which time  $\text{CO}_2$  is freely evolved  $\rightarrow$  methyl 1-[2-(6-methyl-3-pyridazonyl)]ethyl ketone. Y: 78%. F. e. s. J. A. King and F. H. McMillan, Am. Soc. 74, 3222 (1952).

**Cuprous cyanide**

$\text{CuCN}$

**Nitriles from alcohols**

$\text{OH} \rightarrow \text{CN}$

s. 7, 787; s. a. Am. Soc. 74, 2987 (1952)

**Zinc**

$\text{Zn}$

**Knorr pyrrole synthesis** ○

s. 1, 587; also with benzyl instead of ethyl acetoacetate s. S. F. MacDonald, Soc. 1952, 4176

*Ethylmagnesium bromide* $C_2H_5MgBr$ **Synthesis of hydrocarbons  
from p-toluenesulfonic acid esters** $RH + TsOR' \rightarrow R \cdot R'$ 

836.

The Grignard reagent obtained by refluxing  $\beta$ -naphthylacetylene with an equivalent amount of ethyl-MgBr in ether-benzene for 7 hrs. added dropwise with stirring to a refluxing soln. of p-bromobenzyl p-toluenesulfonate in benzene-ether, and refluxed 8 hrs. with stirring  $\rightarrow$  1-(p-bromophenyl)-3-( $\beta$ -naphthyl)-2-propyne. Crude Y: 66%. T. L. Jacobs and S. Singer, *J. Org. Chem.* 17, 475 (1952).

**Acetals from orthoformic acid esters  
Synthesis with addition of 1 C-atom** $CH \rightarrow C \cdot CH(OR)_2$ 

837.

1,5-Octadiyne in ether added during 5 min. to an ethereal soln. of ethyl-MgBr, refluxed 2 hrs. with stirring under  $N_2$ , ethyl orthoformate added, heating under  $N_2$  continued for 6 hrs., the ether distilled off, and the residue heated 1 hr. on a steam bath  $\rightarrow$  2,6-nonadiynal diethyl acetal. Y: 81%. F. Sondheimer, *Am. Soc.* 74, 4040 (1952).

*Dialkylaminomagnesium bromide* $R_2NMgBr$  **$\beta$ -Ketocarboxylic acid esters  
from carboxylic acid esters** $COCHR \cdot COOR'$ 

with diethylamino-magnesium bromide s. 3, 638; with diisopropylaminomagnesium bromide s. L. H. Sommer et al., *Am. Soc.* 75, 2932 (1953)

*Boron fluoride* $BF_3$ **Ketones from carboxylic acid anhydrides** $CO \cdot O \cdot OC \rightarrow COR$ 

s. 4, 725; s. a. G. Tsatsas and J. Hoch, *C. r.* 236, 494 (1953)

 **$\beta$ -Diketones from carboxylic acid anhydrides** $\cdot COCH_2CO \cdot$ 

s. 1, 579; improved procedures s. R. M. Manyik et al., *Am. Soc.* 75, 5030 (1953)

**Acetoacetylation**

38.

A mixture of mesitylene and acetic anhydride satd. with  $\text{BF}_3$  at  $0-10^\circ$  in 2-3 hrs., stirring continued to make a total reaction time of 4 hrs.  $\rightarrow$  mesitylacetone. Y: 57%. F. e. s. H. G. Walker, Jr., J. J. Sanderson, and C. R. Hauser, *Am. Soc.* **75**, 4109 (1953).

**Aluminum chloride****Synthesis of hydrocarbons from p-toluenesulfonic acid esters**

39.

n-Octadecyl p-toluenesulfonate followed by  $\text{AlCl}_3$  added to dry benzene, stirred 15 hrs. at room temp., 10 hrs. at  $50-55^\circ$ , finally 14 hrs. again at room temp.  $\rightarrow$  n-octadecylbenzene. Y: 73%. D. A. Shirley and J. R. Zietz, Jr., *Am. Soc.* **75**, 6333 (1953).

**1,1-Diaryl derivatives from oxo compounds**

s. 2, 664; 5, 548; s. a. E. F. Rogers et al., *Am. Soc.* **75**, 2991 (1953)

**Ammonium acetate****Alkylidenecyanoacetic acid esters**

s. 6, 770; s. a. C. S. Rondestvedt, Jr., and A. H. Filbey, *J. Org. Chem.* **19**, 119 (1954)

**Pyridine ring**

40.

A mixture of benzaldehyde, acetophenone,  $\text{NH}_4$ -acetate, and glacial acetic acid refluxed 1 hr.  $\rightarrow$  2,4,6-triphenylpyridine. Y: 68%.—In the more sluggish reactions, acetic acid is replaced by acetamide. F. e. s. M. Weiss, *Am. Soc.* **74**, 200 (1952).

Acetic anhydride

 $(CH_3CO)_2O$ **Synthesis of ethylene derivatives from aldehydes** $CHO + H_2C \rightarrow CH:C$ 

s. 9, 848

 **$\alpha$ -Nitro- $\beta$ -acylamino-carboxylic acid esters from nitroacetic acid ester and aldehydes or 1,1-di(acylamino) compounds**

$NH_4$ -acetate added to a mixture of acetic anhydride, ethyl nitroacetate, and benzaldehyde,

Ethyl nitroacetate and benzylidene-bisacetamide added to acetic anhydride,

then heated 7 hrs. on a water bath  $\rightarrow$  ethyl  $\alpha$ -nitro- $\beta$ -acetylamino- $\beta$ -phenylpropionate (startg. m. f. 151).

Y: 63%.

Y: 85%.

G. Stefanović and J. Bojanović, J. Org. Chem. 17, 816 (1952); f. reactions with nitroacetic acid ester s. A. Dornow and A. Frese, A. 578. 122 (1952).

Citrate/hydrochloric acid buffer

**Synthesis of aminoketones via partially reduced lactams**

2-Oxoindolizidine allowed to react with  $\frac{1}{4}$  mole + ca. 20% excess  $LiAlH_4$  in abs. ether, treated with a soln. of neutralized benzoylacetic acid in citrate/HCl buffer of pH 4, the ether removed in vacuo, the aq.

soln. allowed to stand 40 hrs. at 20°, acidified to congo red reaction, and heated 20 min. on a steam bath to eliminate CO<sub>2</sub> → *ω*-(2-indolizidyl)acetophenone. Crude Y: 64%. F. e. s. F. Galinovsky, R. Weiser et al., M. 83, 114 (1952); 82, 551 (1951).

#### Formic acid

#### Cleavage of formaldehyde derivatives with 2,4-dimethylphenol

Bis(phenylcarbamidomethyl) ether and 2,4-dimethylphenol in formic acid kept 2 hrs. at 50° → N-(2-hydroxy-3,5-dimethylbenzyl)-N'-phenyl-urea. Crude Y: 90%. F. e. s. G. Zigeuner et al., M. 82, 847 (1951).

#### Acetic acid

#### Thiomethylation with formaldehyde and mercaptans or hydroxymethyl thioethers

A mixture of antipyrine,

phenyl mercaptan, paraformaldehyde, acetic acid, and water heated 23 hrs. on a steam bath

phenylthiomethanol, acetic acid, and water heated 23 hrs. at 100°

Y: 80%.

4-phenylthiomethylantipyrine.

Y: 78%.

F. e. and methods, thiomethylation of phenols in the presence of triethylamine. s. F. Poppelsdorf and S. J. Holt, Soc. 1954, 1124.

#### Phosphate buffer

#### Endimine ring system

s. 8, 816; s. a. K. Zeile and A. Heusner, B. 87, 439 (1954)

Phosphoric acid

 $H_3PO_4$ **Ketones from carboxylic acid anhydrides** $CO \cdot O \cdot OC \rightarrow COR$ 

845.

Guaiacol added to a mixture of acetic anhydride and concd.  $H_3PO_4$  (d. 1.75), refluxed 5 hrs.  $\rightarrow$  acetylisoacetovanillone. Y: 28%; 67% based on startg. m. consumed.—By this procedure, the acetyl group is directed into the position para to the methoxyl group, also in the presence of a free phenolic hydroxyl group. R. Schwarz and K. Capek, M. 83, 883 (1952).

*p*-Toluenesulfonic acid $TsOH$ 

**Reactions with  
azeotropic water separation  
Baeyer condensation  
Triarylmethanes**

 $\leftarrow$ 

846.

The Baeyer condensation proceeds smoothly in 80-90% yield when a benzene soln. of an activated ar. compound, an ar. aldehyde, and *p*-toluenesulfonic acid is refluxed in an apparatus equipped with a Dean-Stark water trap. The amount of water collected indicates the progress of the reaction.—E: *p*-Nitrobenzaldehyde and dimethylaniline  $\rightarrow$  *p*-nitro-*p'*,*p''*-tetramethyldiaminotriphenylmethane. Y: 89%. F. e. s. E. F. Pratt and L. Q. Green, Am. Soc. 75, 275 (1953).

Sulfuric acid

 $H_2SO_4$ 

**Alkylation of isocyclics  
with alcohols**

 $RH + HOR' \rightarrow R \cdot R'$ 

s. 2, 678; diphenylcarbinylation s. D. G. Kundiger and E. B. W. Ovist, Am. Soc. 76, 2501 (1954)

**Synthesis of nitriles from cyanohydrins** $CH(CN)OH \rightarrow CH(CN)R$ 

847.

A suspension of 12 g. 3,4-dimethoxymandelonitrile in 15 ml. veratrole mixed with 74%  $H_2SO_4$ , warmed very gradually to 70° in a water bath

with occasional stirring, and kept 30-40 min. at this temp. after complete dissolution  $\rightarrow$  18 g. bis-(3,4-dimethoxyphenyl)acetonitrile. A. Müller and M. Vajda, J. Org. Chem. 17, 800 (1952).

### Synthesis of hydrocarbons, ethylene derivatives, and sec. alcohols from aldehydes

#### 6-Methylphenanthridine and 6-phenanthridinealdehyde

(2 g. and 1 g.) heated 1.5 hrs. at a bath temp. of 145° with concd.  $H_2SO_4 \rightarrow$  2.1 g. 1,2,3-tri-(6-phenanthridinyl)propane.

(500 mg. each) refluxed 10 min. in acetic anhydride  $\rightarrow$  800 mg. 1,2-di-(6-phenanthridinyl)-ethylene.

(1.5 g. each) refluxed 3.5 hrs. in 80% alcohol  $\rightarrow$  1.95 g. 1,2-di-(6-phenanthridinyl)ethanol,

F. e. s. A. G. Caldwell, Soc. 1952, 2035.

#### Iodine

$HClO_4$

COR

0.05 mole anisole mixed at 0° with 0.025 mole  $HClO_4$ , 0.2 mole propionic acid, and 0.3 mole propionic anhydride, then allowed to stand 2 hrs. at the same temp.  $\rightarrow$  p-methoxypropiophenone. Y: 71%.—Somewhat lower yields, compared with other methods, are offset by the ease of operation. The reaction does not take place with acylated phenols, ar. hydrocarbons, nitrobenzene, or pyridine, nor with guaiacol. F. e. s. H. Kuhn and R. Daxner, M. 83, 689 (1952).

Hydrochloric acid

HCl

## Benzene ring by trimerization

850.

p-tert-Butylacetophenone added to abs. ethanol satd. with HCl, and allowed to stand 30 days  $\rightarrow$  1,3,5-(p-tert-butylphenyl)benzene. Y: 74%. F. e. s. R. E. Lyle et al., Am. Soc. 75, 5959 (1953).

## Quinaldines

## Döbner-Miller synthesis

851.

$\beta$ -Naphthylamine added with stirring to crude concd. HCl, heated on a steam bath, paraldehyde added dropwise with vigorous stirring, whereby the steam bath is removed temporarily to moderate the reaction, stirring continued for 7 hrs.  $\rightarrow$  5,6-benzoquinaldine. Y: 70%. M. Häring, B. Prijs, and H. Erlenmeyer, Helv. 37, 1339 (1954).

## Dihydropyrimidines

852.

A mixture of urea, benzaldehyde, ethyl acetoacetate, ethanol, and 16 drops HCl refluxed 3 hrs.  $\rightarrow$  ethyl 2-hydroxy-4-methyl-6-phenyldihydro-5-pyrimidinecarboxylate. Y: 84.5%. F. e. s. N. V. Khromov-Borisov and A. M. Savchenko, Zh. 22, 1680 (1952); C. A. 47, 9333d.

Iron/cupric sulfate/sulfuric acid

Fe/CuSO<sub>4</sub>/H<sub>2</sub>SO<sub>4</sub>

## Isocyclics from quinones

53.

Glycerol and Fe-filings added uniformly over a period of 3 hrs. at 110–117° to a soln. of thiophanthraquinone in 82.5%–H<sub>2</sub>SO<sub>4</sub> containing CuSO<sub>4</sub>, and the reaction temp. maintained 1 hr. longer → 4,5-benzthio-phanthrone. Y: 63.5%. V. Weinmayr, F. S. Palmer, and A. A. Ebert, Jr., Am. Soc. 74, 4361 (1952).

Via intermediates

54.

9-Diazafluorene added portionwise to 9-fluorenyldimethylamine at ca. 150° so that a steady reaction is maintained without further external heating → 9-dimethylamino-9,9'-bifluorene. Y: 45%. F. e. s. W. R. Bamford and T. S. Stevens, Soc. 1952, 4675.

## C-Cyanomethylation

H → CH<sub>2</sub>CN

55.

A mixture of indole and diethylaminoacetonitrile heated 6 hrs. at ca. 170° under N<sub>2</sub> → indole-3-acetonitrile. Y: 33–44%. E. L. Eliel and N. J. Murphy, Am. Soc. 75, 3589 (1953).

**Reactions of nitroacetic acid ester**  
**Salts of *acti*- $\alpha$ - $\gamma$ -dinitroglutaric acid esters**  
**from nitroacetic acid ester and azomethines**  
**or aldehydes**

856.

Benzylideneaniline allowed to react for a few hrs. with 2 moles nitroacetic acid ester and diethylamine in a mixture of abs. alcohol and ether  $\rightarrow$  diethylammonium salt of *acti*- $\alpha$ , $\gamma$ -dinitro- $\beta$ -phenylglutaric acid ester. Y: 94-98%. F. e., also isolation of the intermediates, s. A. Dornow and A. Frese, A. 578, 122 (1952); from aldehydes s. A. 578, 113; f. reactions s. a. A. 578, 101.

**Synthesis of oxo compounds**  
**from hydrocarbons and amidines**  
**via azomethines**

CH  $\rightarrow$  C·COR

857.

A mixture of thioöxindole (prepn. s. 121) and N,N'-diphenyl-formamidine in ethanol refluxed 15 min.  $\rightarrow$  thioöxindole-3-aldehyde anil (Y: 70-78%) refluxed 1 hr. in aq.-alc. KOH  $\rightarrow$  thioöxindole-3-aldehyde (Y: 72%). With N,N'-diphenylacetamidine at 140-150° without solvent  $\rightarrow$  anil (Y: 64%) hydrolyzed as above  $\rightarrow$  3-acetylthioöxindole (Y: 88-96%). F. e. s. R. H. Glauert and F. G. Mann, Soc. 1952, 2127.

**$\alpha$ , $\beta$ -Ethylene- $\alpha$ -cyanocarboxylic acid esters** C(NHAc)<sub>2</sub>  $\rightarrow$  C:C(CN)COOR  
**from 1,1-di(acylamino) compounds**

858.

3,4-Methylenedioxybenzylidenebisacetamide and ethyl cyanoacetate heated 8 hrs. in an oil bath at 140-150°  $\rightarrow$  ethyl  $\alpha$ -cyano- $\beta$ -(3,4-methylenedioxyphenyl)acrylate. Crude Y: 90.8%. F. e., with lower yields, s. G. Stefanović and Z. Nikić, J. Org. Chem. 17, 1305 (1952).

## Irradiation

Two-step azulene synthesis  
 Ring expansion of isocyclics  
 Dehydration

Nitrosomethylurea added in several portions over a period of 1 hr. to a mixture of indane and aq. 50% -KOH, stirred another hr., the organic layer separated and irradiated 24 hrs. with sun lamps  $\rightarrow$  trimethylene-tropilidene dropped on a column of 5% -Pd on coconut charcoal at 340°/20 mm. during 1 hr.  $\rightarrow$  azulene. Y: 6.7% based on indane consumed. W. von E. Doering, J. R. Mayer, and C. H. DePuy, Am. Soc. 75, 2386 (1953).

## Sodium hydride

NaH

Synthesis of  $\alpha$ -aminocarboxylic acids  $\text{CH}_2\text{N(R)}_2 \rightarrow \text{CH}_2\text{CH(NH}_2\text{)COOH}$   
 with tert. amines  
 Simultaneous cleavage  
 of carbobenzoxy derivatives of amines  
 and benzyl esters

A soln. of dibenzyl carbobenzoxyaminomalonate and 2-carbethoxy-3-diethylaminomethylindole in dry xylene containing a trace of NaH refluxed, while a stream of  $\text{N}_2$  is bubbling through, until after 3.5 hrs. the theoretical amount of diethylamine has been given off  $\rightarrow$  condensation product (Y: 89%) hydrogenated with 10% -Pd-on-charcoal in dry methanol for 3 hrs., and a soln. of the crude product in benzene evaporated three times to dryness  $\rightarrow$  2-carbethoxytryptophan (Y: 76%). F. e. s. H. M. Kissman and B. Witkop, Am. Soc. 75, 1967 (1953).

## Sodium hydroxide

NaOH

Syntheses with tert. amines

s. 6, 789; s. a. H. Hellmann and E. Brendle, H. 287, 235 (1951); with diethyl formamidomalonate s. a. A. Ek and B. Witkop, Am. Soc. 76, 5579 (1954)

**C- $\beta$ -Acylethylation**  
 **$\gamma$ -Nitroketones from tert. amines**

A soln. of  $\beta$ -dimethylaminopropiophenone in excess 2-nitropropane containing solid NaOH refluxed 6.5 hrs. in an  $N_2$ -atmosphere until evolution of volatile base ceases  $\rightarrow$  2-methyl-2-nitro-5-phenyl-5-pentanone. Y: 82%. F. e. s. N. S. Gill et al., Am. Soc. 74, 4923 (1952).

Sodium/alcohol

NaOR

**Isatylidene compounds**

Oxindole dissolved in a soln. of Na in abs. alcohol,  $\alpha$ -acetamidoacrylic acid added, and refluxed 6 hrs. under  $N_2 \rightarrow$  Na-isatylidenemethylacetate. Y: 97%. F. e. s. P. L. Julian et al., Am. Soc. 75, 5305 (1953).

Potassium tert-butoxide

KOR

**Cyclohexenones from  $\beta$ -aminoketones**

A mixture of  $\beta$ -dimethylamino-p-hydroxypropiophenone hydrochloride, ethyl  $\alpha$ -ethylacetoacetate, and K-*tert*-butoxide in dioxane refluxed 24 hrs.  $\rightarrow$  3-(p-hydroxyphenyl)-6-ethyl-2-cyclohexen-1-one. Y: 71.4%.—If the product does not crystallize, it is saponified with aq. alkali for 2 hrs. to eliminate the carbalkoxy group completely. F. e. s. F. C. Novello, M. E. Christy, and J. M. Sprague, Am. Soc. 75, 1330, 5431 (1953).

## Phenyllithium

Introduction of aldehyde groups  
into ar. nuclei

864.

A soln. of 5-methoxy-2-thienyl-Li prepared from 2-methoxythiophene and phenyl-Li (from Li and bromobenzene) in ether added in a slow stream with efficient stirring to an ice-cold soln. of a slight excess of dimethylformamide in ether, and left at room temp. overnight  $\rightarrow$  5-methoxy-2-thienaldehyde. Y: 67%.—The secondary products (dimethylamine and unreacted dimethylformamide) are water soluble, which simplifies the isolation of the aldehyde. J. Sicé, Am. Soc. 75, 3697 (1953). s. 2, 694; s. a. J. P. Lambooy, Am. Soc. 76, 133 (1954)

Nitriles from organometallic compounds  
Replacement of hydrogen by cyano groups

865.

Collidine treated under  $N_2$  at room temp. with an ethereal N phenyl-Li soln., allowed to stand 1 hr. at room temp., then treated at  $-15^\circ$  with an ethereal soln. of N-methyl-N-cyanoaniline, and the product isolated after 24 hrs.  $\rightarrow$  (4,6-dimethyl-2-pyridyl)malondinitrile. Y: 70%.—Compared with cyanogen chloride, N-methyl-N-cyanoaniline has the advantage of easier handling and dosage. F. e., also mononitriles, s. H. Lættre, P. Jungmann, and J.-C. Salfeld, B. 85, 397 (1952).

## Alkali cyanide

Carboxylic acids from  
quaternary ammonium salts via nitriles  
Synthesis with addition of 1 C-atom

866.

Gramine methiodide added to a soln. of KCN in 60% aq. ethanol, then a  $N_2$ -stream passed through for 24 hrs. whereby trimethylamine is removed, aq. 20% -KOH added, and refluxed 10 hrs.  $\rightarrow$  3-indoleacetic acid.

Y: 76%. T. A. Geissman and A. Armen, *Am. Soc.* 74, 3916 (1952); without KOH in an autoclave at 150-160° s. A. P. Terent'ev, A. N. Kost, and S. M. Gurvich, *Ж.* 23, 615 (1953); with NaCN s. J. Thesing and F. Schülde, *B.* 85, 324 (1952); phthalimidoacetonitriles s. H. Hellmann, J. Löschmann, and F. Lingens, *B.* 87, 1691 (1954).

### Copper

Cu

### $\alpha,\beta$ -Ethylene- $\gamma$ -diketones from $\alpha$ -diazoketones Dimerization

867.

$\alpha$ -Diazoacetophenone in benzene treated with Cu-bronze (Naturkupfer C) at 65-70°  $\rightarrow$  *trans*-1,2-dibenzoyl ethylene. Y: 70%. P. Yates, *Am. Soc.* 74, 5376 (1952).

### Cuprous cyanide

CuCN

### Replacement of amino by cyano groups

s. 3, 666; s. a. R. H. Miller and O. Gisvold, *J. Am. Pharm. Assoc.* 42, 367 (1953)

### Cupric sulfate

CuSO<sub>4</sub>

### Synthesis of oxo compounds from amines and oximes

A soln. of p-chlorobenzenediazonium chloride, prepared from p-chloroaniline, HCl, and ice-water by treatment with aq. NaNO<sub>2</sub> at 0-5°, neutralized towards Congo-red by addition of aq. Na-acetate, introduced at 10-15° with stirring below the surface of aq. formaldoxime to which has been added Cu-sulfate, some Na-sulfite, and Na-acetate, stirring continued for 1 hr., acidified with excess HCl, then refluxed 2 hrs.  $\rightarrow$  p-chlorobenzaldehyde. Y: 60%. F. e. s. W. F. Beech, *Soc.* 1954, 1297.

### Cupric chloride

CuCl<sub>2</sub>

### Diazo coupling 1,4-Addition

Acetic anhydride

 $(CH_3CO)_2O$ **Syntheses with 1,1-di(acylamino) compounds**

s. 9, 841; s. a. J. Org. Chem. 17, 1114 (1952)

Formic acid

 $HCOOH$ **Cleavage of formaldehyde derivatives with 2,4-dimethylphenol**

869.

Methylenebis(phenylurea) and 2,4-dimethylphenol in formic acid kept 2 hrs. at  $50^\circ \rightarrow$  N-(2-hydroxy-3,5-dimethylbenzyl)-N'-phenylurea. Y: 95%. F. e. s. G. Zigeuner et al., M. 82, 494 (1951).

Polyphosphoric acid

 $H(PO_3H)_xOH$ **Fischer indole ring synthesis**

870.

Polyphosphoric acid added to a mixture of acetophenone and phenylhydrazine, stirred and warmed gently until a sudden rise of temp. indicates beginning of the reaction, then the temp. kept at  $180^\circ$  by water-cooling  $\rightarrow$  2-phenylindole. Y: 76%. F. e. s. H. M. Kissman, D. W. Farnsworth, and B. Witkop, Am. Soc. 74, 3948 (1952); from hydrazones s. J. Org. Chem. 19, 1824 (1954).

Phosphorus oxychloride

 $POCl_3$ **Aldehyde synthesis with dimethylformamide** $H \rightarrow CHO$ 

871.

$POCl_3$  added dropwise with stirring and cooling to dimethylformamide, then technical dimethylaniline added dropwise with stirring, and heated 2 hrs. with stirring on a steam bath  $\rightarrow$  p-dimethylaminobenzaldehyde. Y: 70.5%.—Dimethylformamide gives somewhat lower yields than N-methylformanilide but has the advantage of being inexpensive. F. e. s. E. Campaigne and W. L. Archer, Am. Soc. 75, 989 (1953); s. a. Org. Synth. 33, 27 (1953); F. T. Tyson and J. T. Shaw, Am. Soc. 74, 2273 (1952); W. E. Parham and V. J. Traynelis, Am. Soc. 76, 4960 (1954).

### Synthesis of ketones from carboxylic acid amides

H → COR

872.

A mixture of julolidine, benzanilide, and  $\text{POCl}_3$  heated 1 hr. at  $120^\circ$ , then boiled a short time with concd.  $\text{HCl}$  → 9-benzoyljulolidine. Y: 70%.—Friedel-Crafts synthesis was not successful. F. e. s. P. A. S. Smith and Tung-Yin Yu, *J. Org. Chem.* **17**, 1281 (1952).

Hydrochloric acid

HCl

### Fischer-Zerweck aldehyde synthesis

H → CHO

873.

A slow current of  $\text{HCl}$  passed for 2 hrs. with ice-salt cooling and frequent shaking into a soln. of ethyl 4-carbethoxymethyl-2-methylpyrrole-5-carboxylate in dry ether-chloroform- $\text{HCN}$ ,  $\text{HCl}$  passed in at an increased rate, while crystals separate and for 2 hrs. thereafter, the aldimine hydrochloride filtered off, washed with ether, dried in vacuo, dissolved in ice-water, quickly filtered, and the pH brought to 4 → 5-carbethoxy-4-carbethoxymethyl-2-methylpyrrole-3-aldehyde. Y: 97%. S. F. MacDonald, *Soc.* **1952**, 4184.

### Halogen †

CC†Hal

Without additional reagents

### 1,1,2,2-Tetraarylethanes

 $\text{Ar}_2\text{CHCHAr}_2$ 

874.

2 g.  $\alpha,\alpha,\beta$ -trichloroethyl phenyl ether and 3.8 g. o-cresol allowed to react at  $50^\circ$  for 3 hrs. → 3 g. 1,1,2,2-tetrakis-(3-methyl-4-hydroxy-

phenyl)ethane. E. Ziegler, W. Kaufmann, and N. Kreisel, M. 83, 1274 (1952).

### Synthesis of $\alpha,\beta$ -ethyleneketones from carboxylic acid chlorides

A mixture of 1,1-diphenylethylene and benzoyl chloride heated 30 hrs. at 190-200° while dry  $\text{N}_2$  is bubbled through  $\rightarrow$  1-benzoyl-2,2-diphenylethylene. Y: 46%.—The condensation could not be performed with satd. aliphatic acyl chlorides because of their thermal instability. F. e. s. F. Bergmann, S. Israelashvili, and D. Gottlieb. Soc. 1952, 2522.

### 2-Acylamino-1,3-diols from carboxylic acids via $\alpha$ -bromocarboxylic acid bromides, $\alpha$ -diazo- $\beta$ -keto- $\gamma$ -bromocarboxylic acid esters, and $\alpha$ -amino- $\beta$ -ketocarboxylic acid esters

Palmitic acid allowed to react with dry red P and Br  $\rightarrow$  crude  $\alpha$ -bromopalmitoyl bromide (Y: 96.5%) added at 15-18° with vigorous stirring during 3.5-4 hrs. to crude ethyl diazoacetate, stirring continued 3 hrs. at 20°, allowed to stand overnight at the same temp., then warmed at 30-35° with stirring until  $\text{N}_2$ -evolution ceases  $\rightarrow$  crude ethyl DL-2-diazo-3-oxo-4-bromostearate (Y: 72.8%) hydrogenated with prehydrogenated Pd-on-carbon in alcohol containing HCl  $\rightarrow$  crude ethyl DL-2-amino-3-oxostearate hydrochloride shaken 5 hrs. with acetic anhydride and Ag-acetate in methanol at room temp. in the dark  $\rightarrow$  ethyl DL-2-acetamino-3-oxostearate dissolved in abs. tetrahydrofuran, added dropwise with vigorous stirring at 20-30° during 15 min. to a soln. containing  $\text{NaBH}_4$  and LiI in tetrahydrofuran, stirring continued 5 hrs. at 20°, then allowed to stand overnight  $\rightarrow$  mixture of racemates of 2-acetaminooctadecane-1,3-diols (Y: 89%). Over-all Y: 26%. I. Sallay, F. Dutka, and G. Fodor, Helv. 37, 778 (1954); reduction with  $\text{NaBH}_4$ /LiI s. a. J. Kollontitsch, O. Fuchs, and V. Gábor, Nature 173, 125 (1954).

**$\alpha$ -Diazoketones from carboxylic acids  
via carboxylic acid chlorides**

877.

Abs. benzene poured over 3-keto-4-etienic acid, then oxalyl chloride added at  $0^\circ$  under anhydrous conditions, kept 20 min. at  $20^\circ$  with occasional swirling until dissolved, then an additional 20 min. at the same temp., evaporated in vacuo, dissolved in benzene, added at  $-10^\circ$  to ethereal diazomethane (prepn. s. original), and allowed to stand 1 hr. at  $20^\circ \rightarrow$  21-diazoprogesterone. Y: 75%.—Neither use of the Na-salt of the acid, nor addition of pyridine (cf. Synth. Meth. 7, 583) was advantageous for the preparation of the acid chloride. F. e. s. F. Reber, A. Lardon, and T. Reichstein, *Helv.* 37, 45 (1954).

**Arndt-Eistert synthesis**

s. 2, 771; 1, 190; with  $\alpha$ -aminoacids s. K. Balenović and D. Dvornik. Soc. 1954, 2976

**Lithium**

Li

**Synthesis of hydrocarbons from halides  
Inverse addition of organometallic reagents**

p-Methoxyphenyl-Li, prepared from p-methoxyphenyl bromide and Li in ether under  $\text{N}_2$ , added dropwise to a vigorously stirred ethereal soln. of 3-bromocyclohexene, and refluxing continued for 2 hrs.  $\rightarrow$  3-(p-methoxyphenyl)cyclohexene. Y: 71%.—Inverse addition of the organometallic compound gives better yields, an effect particularly marked with Grignard reagents. F. e. s. W. R. Biggerstaff, A. P. Menditto, and I. Yokoyama, *J. Org. Chem.* 19, 934 (1954).

**Sodium/potassium isopropoxide**

Na/KOR

**Synthesis of hydrocarbons**

K-isopropoxide added to Na-sand in sulfur-free toluene, then n-amyl chloride added dropwise with vigorous stirring and cooling at  $20^\circ$ , and stirring continued for 45 min.  $\rightarrow$  n-hexylbenzene. Y: 76%. F. additional reagents s. A. A. Morton and A. E. Brachman, *Am. Soc.* 73, 4363 (1951); 76, 2980 (1954).

## Sodium hydride

NaH

**Synthesis of hydrocarbons  
via 1,1-disulfones**

←

Molar equivalents of Na-bis(ethylsulfonyl)methane and isoamyl bromide thoroughly mixed in dimethylformamide, and stirring continued at 80-90° for 1 hr. → 1,1-bis(ethylsulfonyl)-4-methylpentane (startg. m. f. 767) (Y: 85%) added to an ice-cooled suspension of NaH in dimethylformamide, the ice bath removed after 5 min., stirred 2-3 hrs., isoamyl bromide added, and stirring continued at 90-95° for 18 hrs. → 5,5-bis(ethylsulfonyl)-2,8-dimethylnonane (Y: 72%) heated 36 hrs. with Raney-Ni in cyclohexane at 250° and 2500 p.s.i. H<sub>2</sub> → 2,8-dimethylnonane (Y: 78%). F.e., also without isolation of the monoalkylated bis(ethylsulfonyl)methane, and partial desulfuration, s. M. W. Cronyn, Am. Soc. 74, 1225 (1952); J. Org. Chem. 19, 139 (1954); hydrogenation cf. Synth. Meth. 9, 378.

40 hrs. until the test of organo-Li compounds is negative  $\rightarrow$  2,2'-methylenedithiophene. Y: 66%. N. Löfgren and C. Tegner, *Acta Chem. Scand.* 6, 1020 (1952).

### Syntheses with lithium alkenyls

$\alpha,\beta$ -Acetylenecarboxylic acids from  $\alpha,\beta$ -ethylenehalides. A soln. of butyl-Li in ether added at  $-35^\circ$  over a period of 4.5 min. to a mixture of *cis*- and *trans*- $\omega$ -bromostyrene dissolved in ether, after an additional 1.5 min. poured onto Dry Ice, and the product isolated as the anilinium salt  $\rightarrow$  anilinium phenylpropionate. Y: 45%. F. syntheses without dehydrohalogenation s. D. Y. Curtin and E. E. Harris, *Am. Soc.* 73, 4519 (1951). *trans* and *cis* ethylene derivatives with Li cf. A. S. Dreiding and R. J. Pratt, *Am. Soc.* 76, 1902 (1954).

### Phenyllithium

### Synthesis of hydrocarbons from halides Metalation

887.

6.0 g. 2,2'-dipyridylmethane added slowly at  $0^\circ$  to ethereal phenyl-Li (from bromobenzene and Li), after stirring for 30 min. ethyl bromide in ether added, and stirred 6 hrs. at room temp.  $\rightarrow$  5.9 g. 1,1-di-2-pyridylpropane. F. e. s. E. Leete and L. Marion, *Can. J. Chem.* 30, 563 (1952); 4-alkylpyridines s. J. P. Wibaut and J. W. Hey, *R.* 72, 513 (1953).

### Alkylation of Reissert compounds

s. 9, 581

### Dimerization of halides Isocyclics from halides

s. 9, 966

Potassium amide

KNH<sub>2</sub>**Polymethylenebipyridines**

←

4-Picoline added with stirring at  $-80^\circ$  to liq. NH<sub>3</sub> containing KNH<sub>2</sub>, stirring continued for 10 min., trimethylene dibromide in ether slowly added, and stirred for 3 more hrs. at  $-80^\circ \rightarrow$  4,4'-pentamethylenebipyridine. Y: 64%. F. e. s. L. M. Jampolsky et al., Am. Soc. 74, 5222 (1952).

**Selective alkylation of ketones  
via  $\alpha$ -alkoxymethyleneketones**

←

s. 4, 775; s. a. V. Sýkora et al., Collection Czechoslov. Chem. Commun. 19, 566 (1954)

Potassium carbonate

K<sub>2</sub>CO<sub>3</sub>**Alkylation of  
 $\alpha$ -cyanocarboxylic acid esters** $\cdot\text{HC}(\text{CN})\text{COOR} \rightarrow \cdot\text{R}'\text{C}(\text{CN})\text{COOR}$ 

s. 6, 802; s. a. P. E. Gagnon, G. Nadeau, and R. Côté, Can. J. Chem. 30, 592 (1952)

Sodium cyanide

NaCN

**Replacement of halogen by cyano groups**Hal  $\rightarrow$  CN

890. n-Butyl bromide stirred and refluxed 1 hr. with NaCN in *ethylene glycol*  $\rightarrow$  valeronitrile. Y: 90%. F. e., also from sec. and tert. halides, s. R. N. Lewis and P. V. Susi, Am. Soc. 74, 840 (1952).

s. 3, 682; s. a. E. B. Reid and T. E. Gumpf, J. Org. Chem. 18, 661 (1953)

Potassium cyanide

KCN

**Carboxylic acids from halides  
Labeled compounds**Hal  $\rightarrow$  COOH

1-Bromo-8,9-dihydroxyheptadecane and KC<sup>13</sup>N refluxed 48 hrs. in ethanol-water (10:1), KOH added, and refluxing continued for a further 48 hrs.  $\rightarrow$  dihydroxystearic acid-1-C<sup>13</sup>. Y: 85%. S. Bergström, K. Pääbo, and M. Rottenberg, Acta Chem. Scand. 6, 1127 (1952).

Sodium iodide/sodium compound

Synthesis of  $\gamma$ -diketones  
 from  $\beta$ -ketocarboxylic acid esters  
 via  $\beta,\gamma'$ -diketocarboxylic acid esters  
 Furans from  $\beta$ -diketones

892.

Sodioacetoacetic ester and a little NaI dissolved at 60-70° in dry acetone, chloroacetone added dropwise with stirring during 20 min., refluxing and stirring continued for 1 hr., acetone distilled off,

and the product isolated  $\rightarrow$  crude  $\alpha$ -acetylacetoacetic ester (Y: 89%) refluxed 75 min. with finely powdered crystalline oxalic acid, and the resulting ester hydrolyzed by refluxing 45 min. with methanolic KOH  $\rightarrow$  2,5-dimethylfuran-3-carboxylic acid (Y: 91%).—Ring closure occurs also during distillation of  $\alpha$ -acetylacetoacetic ester.

and the resulting mixture of  $\alpha$ -acetylacetoacetic ester and NaCl refluxed 1 hr. with aq. 3% -KOH  $\rightarrow$  acetonylacetone (Y: 65-70%).

O. Dann, H. Distler, and H. Merkel, B. 85, 457 (1952).

Potassium iodide/potassium hydroxide and copper/potassium hydroxide

KI/KOH and Cu/KOH

Alkylation of  $\beta$ -diketones

$\text{CO} \cdot \text{CH} \cdot \text{CO} \rightarrow \text{CO} \cdot \text{CR} \cdot \text{CO}$

893.

Allyl bromide and Cu-powder added to a soln. of dihydroresorcinol in aq. 20% -KOH, and stirred 5 hrs. at room temp.  $\rightarrow$  2-allyl-1,3-cyclohexanedione. Y: 75%. F. e., also from chlorides in the presence of KI. s. H. Stetter et al., B. 85, 1061 (1952); 87, 1331, 1617 (1954).

## Choline

Ethylene derivatives from halides  
by dimerization

894.

A 50% soln. of choline in methanol added to a soln. of 2,7-dimethyl-9-bromofluorene in acetone, and the product isolated after 30 min.  $\rightarrow$  2,2',7,7'-tetramethyl-9,9'-bifluorene. Y: 75.5%. F. e. s. E. D. Bergmann et al., *Bl.* 1952, 78.

## Triethylamine

## Penicilline ring system

895.

Succinimidoacetyl chloride in methylene chloride added to a soln. of 2-phenyl-2-thiazoline in methylene chloride, stirred rapidly and a dil. soln. of triethylamine in methylene chloride added over a 6 hr. period through a high-dilution cycle (s. *Am. Soc.* 73, 4367 (1951))  $\rightarrow$  2-phenyl- $\alpha$ -succinimido-2-thiazolidineacetic acid  $\beta$ -lactam. Crude Y: 56%; pure Y: 30%. F. e. s. J. C. Sheehan et al., *Am. Soc.* 73, 4376, 4752, 4756 (1951).

## Pyridine

## Isoflavones

896.

Ethoxalyl chloride added at  $0^\circ$  with shaking to a soln. of 2-methoxybenzyl 2,4,6-trihydroxyphenyl ketone in pyridine, and the product isolated after 24 hrs.  $\rightarrow$  2-carbethoxy-5,7-dihydroxy-2'-methoxyisoflavone. Y: 84%. (*Soc.* 1953, 1860.)—This method is particularly suited for the preparation of polyhydroxy- and partly alkoxyated hydroxyisoflavones (*Soc.* 1953, 1852). W. Baker et al., *Soc.* 1953, 1860; f. e. s. *Soc.* 1953, 1852.

## Copper

Cu

**Diaryls from aryl halides  
by dimerization**

97. cf. Synth. Meth. 1, 660-2.

Dimethylformamide is a good solvent for this reaction. It offers, however, no advantage with those halides which are inert under the usual conditions. E. s. N. Kornblum and D. L. Kendall. Am. Soc. 74, 5782 (1952).

*Cuprous cyanide*

CuCN

**Nitriles from halides**

s. 2, 728; also with  $\text{Zn}(\text{CN})_2$  s. G. Lock and V. Rieger, B. 86, 74 (1953)

98.

**Rosenmund-von Braun nitrile synthesis.** A mixture of 0.39 mole 1-methyl-8-chloro-1,2,3,4-tetrahydronaphthalene (prepn. s. 117), 0.44 mole dry CuCN, acetonitrile, and pyridine heated 33 hrs. at 240-250° with shaking  $\rightarrow$  1-methyl-8-cyano-1,2,3,4-tetrahydronaphthalene. Y: 81%. F. e. s. J. Cason and D. D. Phillips, J. Org. Chem. 17, 298 (1952); in boiling quinoline s. J. H. Burckhalter et al., Am. Soc. 76, 4112 (1954).

**Carboxylic acids from halides**

s. 8, 856; furan derivatives s. O. Moldenhauer, G. Trautmann, and R. Pfluger, A. 580, 188 (1953)

 **$\alpha,\beta$ -Ethylenenitriles****from ethylene derivatives****via 1,2-dibromides and  $\alpha$ -bromonitriles**

99.

Br added at  $-50^\circ$  to an ethereal soln. of 2-methoxymethyl-2,3-dihydropyran, then dry powdered CuCN added, refluxed 4 hrs., cooled, extracted with ether, finally piperidine added, and refluxed 2 hrs.  $\rightarrow$  2-methoxy-6-cyano-2,3-dihydropyran. Y: 60%. R. Paul and S. Tehelitcheff. Bl. 1952, 808.

Silver perchlorate

 $\text{AgClO}_4$ 

Ketones from carboxylic acid chlorides

 $\text{COCl} \rightarrow \text{COR}$ 

s. 7, 838; s. a. Soc. 1953, 827

Magnesium

Mg

Replacement of alkoxy by alkyl

 $\text{OR} \rightarrow \text{R}'$ 

s. 5, 596; partial replacement s. Am. Soc. 74, 1624 (1952)

Synthesis of hydrocarbons from halides

 $\text{RHal} + \text{HalR}' \rightarrow \text{R} \cdot \text{R}'$ 

**Ethylenesilanes.** An ethereal soln. of allyl bromide added to the Grignard reagent from  $\alpha$ -bromobenzyltrimethylsilane in ether, and refluxed 4.5 hrs.  $\rightarrow$  4-trimethylsilyl-4-phenyl-1-butene. Y: 74%. F. e. s. C. R. Hauser and C. R. Hance, Am. Soc. 74, 5091 (1952).

**3-Pyridyl compounds.** Allyl bromide added with cooling to an ethereal soln. of 3-pyridyl-MgBr, prepared from 3-bromopyridine and Mg by the entrainment method with the use of ethyl bromide as activator, allowed to stand 12 hrs., then heated for another hr.  $\rightarrow$  3-(3-pyridyl)propene. Y: 79%. F. e. s. J. P. Wibaut and H. G. P. van der Voort, R. 71, 798 (1952); methyl iodide as activator s. P. Cagniant, Bl. 1953, 62.

**Selective replacement  
of chlorine**

s. 6, 806; s. a. O. Riobè, C. r. 236, 2073 (1953)

**Inverse addition  
of organometallic reagents**

s. 9, 878

**Synthesis of hydrocarbons from halides  
and acoxy compounds**

 $\text{RHal} + \text{AcOR}' \rightarrow \text{R} \cdot \text{R}'$ 

s. 4, 781; also hydrogenolysis s. R. C. Fuson et al., Am. Soc. 76, 499 (1954)

**Sec. alcohols from carboxylic acid esters**

s. 7, 841: use of isopropyl-MgBr as reducing agent s. O. R. Pierce, J. C. Siegle, and E. T. McBee, *Am. Soc.* **75**, 6324 (1953)

**Synthesis of ethers from acetals**

02.

N-(Di-n-butyl)aminoacetaldehyde diethylacetal added to ethereal phenyl-MgBr. heated with stirring while most of the ether is removed by distillation. xylene added, distillation continued until the temp. of the reaction mixture reaches 135-140°, then refluxed 4 hrs. with stirring → (β-phenyl-β-ethoxyethyl)di-n-butylamine. Y: 80%.—This method has serious limitations as to yield and purity of product. F. e. s. I. A. Kaye and I. C. Kogon, *Am. Soc.* **73**, 4893 (1951).

**Aldehydes from halides  
via acetals****Synthesis with addition of 1 C-atom**

03.

A mixture of 3-bromopyridine and ethyl bromide as activator allowed to react with Mg, the ether replaced by benzene, then ethyl orthoformate added, refluxed 1 hr., then allowed to stand 12 hrs. → nicotinaldehyde diethyl acetal (Y: 50-58%) refluxed 2 hrs. with 10% HCl under N<sub>2</sub>, allowed to stand 12 hrs. at room temp. under N<sub>2</sub>, made alkaline with concd. aq. NaOH, and extracted with chloroform → nicotinaldehyde (Y: 82-86%). Over-all Y: 42-49%. F. e., also n-butyl bromide as activator (R. 71, 798), s. J. P. Wibaut, R. Huls, and H. G. P. van der Voort, *R.* **71**, 1021, 798 (1952).

**Magnesium/alcohol****C-Acylation**

04.

Mg allowed to react at room temp. with abs. ethanol, the reaction being initiated by addition of a little CCl<sub>4</sub>, dry ether added when the reaction subsides, stirred 2-3 hrs. until the reaction stops, acetoacetic ester in dry ether added slowly with ice-cooling and vigorous stirring, then phenacetyl chloride added dropwise with ice-salt cooling and vigorous stirring, which is continued for 1 hr. at room temp., then allowed to stand overnight → α-phenacetylacetoacetic ester. Y: 85%. F. e. s. M. Viscontini et al., *Helv.* **35**, 2280 (1952); **37**, 41 (1954).

Zinc/acetic anhydride

 $\text{Zn}/(\text{CH}_3\text{CO})_2\text{O}$ **Dimerization of halides** $2\text{RHal} \rightarrow \text{R}\cdot\text{R}$ 

905.

A mixture of n-perfluoropropyl iodide, granular Zn, acetic anhydride, and methylene chloride refluxed 24 hrs. at 40–45°  $\rightarrow$  n-perfluorohexane. Y: 77%; conversion: 74%. F. e. s. A. L. Henne et al., *Am. Soc.* 75, 5750 (1953).

Alkylmagnesium halide

 $\text{RMgHal}$ **Synthesis of hydrocarbons from halides** $\text{RH} + \text{HalR}' \rightarrow \text{R}\cdot\text{R}'$ 

906.

Indole in benzene added slowly with stirring to 20% excess ethereal ethyl-MgBr, stirring continued for 20 min., allyl bromide in benzene added slowly, and stirred overnight at 20°  $\rightarrow$  3-allylindole. Y: 70%. J. B. Brown, H. B. Henbest, and E. R. H. Jones, *Soc.* 1952, 3172.

Cadmium chloride

 $\text{CdCl}_2$ **Ketones from carboxylic acid chlorides** $\text{COCl} \rightarrow \text{COR}$ 

s. 3, 694; s. a. M. Renson and R. Huls, *Bl. Soc. chim. Belg.* 61, 599 (1952)

**Diketodicarboxylic acid esters from dihalides**

907.

$$\downarrow$$

10% excess anhydrous  $\text{CdCl}_2$  added with rapid stirring to a cooled Grignard reagent prepared from 1,10-dibromodecane and Mg in anhydrous ether under  $\text{N}_2$  in the presence of a small crystal of iodine, the ice bath removed after 5 min., allowed to warm to room temp. during 10 min., refluxed 45 min. on a steam bath, the ether replaced by benzene, refluxed several min., transferred during 15 min. by means of low pressure  $\text{N}_2$  to a rapidly stirred and refluxing soln. of ethyl  $\omega$ -(chloroformyl)valerate in benzene, refluxed 2 hrs. with stirring, and allowed to stand overnight  $\rightarrow$  diethyl 6,17-diketodocosane-1,22-dioate. Y: 39.1%. F. e. with lower yields s. A. Kreuchunas, *Am. Soc.* 75, 3339 (1953).

Aluminum chloride

 $AlCl_3$ **Friedel-Crafts ketone syntheses** $RH \rightarrow RCOR'$ 

908.

3-Methylfilicinic acid and  $AlCl_3$  covered with a layer of  $CS_2$ , then nitrobenzene added dropwise, refluxed 15 min., acetyl chloride added, and refluxing continued for 1 hr.  $\rightarrow$  5-acetyl-3-methylfilicinic acid. Y: 64%. W. Riedl and K. H. Risse, B. 87, 865 (1954); method s. A. 585, 38 (1954).

 **$\alpha,\beta$ -Ethyleneketones**

s. 6, 814; vinyl ketones s. M. W. Bullock et al., Am. Soc. 76, 1828 (1954); Q. F. Soper et al., Am. Soc. 76, 4109 (1954)

**Ketothioethers**

909.

Acetyl chloride added at 0-10° to a well stirred slurry of anhydrous  $AlCl_3$  and dry chloroform, then methyl phenyl sulfide added dropwise at 0-5°, the cooling bath removed, stirring continued and the reaction mixture allowed to warm to 20°  $\rightarrow$  p-methylmercaptoacetophenone. Y: 98%. F. e. s. R. A. Cutler, R. J. Stenger, and C. M. Suter, Am. Soc. 74, 5475 (1952).

**Improved Zincke-Suhl synthesis of cyclohexadienones** $\leftarrow$ **Synthesis of ketones from 1,1,1-trichlorides**

910.

A soln. of p-cresol in  $CS_2$  added dropwise during 10-15 min. to a stirred suspension of  $AlCl_3$  in  $CS_2$ , then  $CCl_4$  added in one portion, and warmed 2 hrs. at 45°  $\rightarrow$  4-methyl-4-trichloromethyl-2,5-cyclohexadienone. Y: 60.3%. (J. Org. Chem. 19, 978.)—Similarly with phenol and benzotrichloride at 0°  $\rightarrow$  p-hydroxybenzophenone. Y: 90.2%. (J. Org. Chem. 19, 985.) F. e. s. M. S. Newman and A. G. Pinkus, J. Org. Chem. 19, 978, 985, and f. papers of this series.

Aluminum bromide

AlBr<sub>3</sub>**Synthesis of hydrocarbons from bromides**

Br → R

A soln. of anhydrous AlBr<sub>3</sub> in benzene added during 30 min. to a stirred suspension of dibromohydrocinnamic acid in benzene, and refluxed 4 hrs. with stirring → α,β,β-triphenylpropionic acid. Y: 66-100%. C. P. Krimmel et al., Org. Synth. 33, 98 (1953).

**Friedel-Crafts ketone syntheses  
Ketomercaptans**

RH → RCOR'

s. 9, 655

Stannic chloride

SnCl<sub>4</sub>**Darzens synthesis**

COCl → COR

**Unsatd. ketones from carboxylic acid  
chlorides**

## Acetylenedicarboxylic acid esters synthesis

## Alder-Rickert synthesis

## Valence tautomerism

17.

1,3,5-Cyclooctatriene regenerated from the Ag-nitrate complex with aq.  $\text{NH}_3$ , taken up in benzene, dried over silica gel, added to dimethyl acetylenedicarboxylate, and warmed 24 hrs. at  $60^\circ$  under  $\text{N}_2 \rightarrow$  adduct (Y: 77%) heated 20 min. under  $\text{N}_2$ ,  $200^\circ/100$  mm.  $\rightarrow$  cyclobutene (Y: 95%) and dimethyl phthalate.—1,3,5-Cyclooctatriene is in mobile equilibrium with bicyclo[4.2.0]octa-2,4-diene. A. C. Cope et al., Am. Soc. 74, 4867 (1952).

## Elimination

Hydrogen  $\uparrow$ CC  $\uparrow$  H

Calcined magnesite

MgO

 $\alpha,\beta$ -Ethylenearenes  
by dehydrogenationCHCH  $\rightarrow$  C:C

18.

Ethlynaphthalene (ca. 50:50 mixture of  $\alpha$ - and  $\beta$ -isomers) passed at  $600^\circ/100$  mm over calcined magnesite for 3 hrs. with a contact time of 1 sec.  $\rightarrow$  vinylnaphthalene. Y per pass: 44.7%; ultimate Y: 90.3%.—In general, the yield is benefited by low temp., low pressure, short contact time, and high ratio of diluent to startg. m. in the feed stock. Steam is superior to benzene as diluent because of the greater ease of final separation. F. catalysts s. J. E. Nickels and B. B. Corson, Ind. Eng. Chem. 43, 1685 (1951).

Zinc oxide-alumina-calcium oxide

ZnO,  $\text{Al}_2\text{O}_3$ , CaODehydrogenation  
in the vapor phase

19.

A mixture of acenaphthene and steam as diluent passed at ca.  $600$ – $650^\circ$  through a ZnO,  $\text{Al}_2\text{O}_3$ , CaO-catalyst  $\rightarrow$  acenaphthylene. Y: 90%; purity

up to 98%. M. Kaufman and A. F. Williams, *J. Applied Chem.* 1, 489 (1951).

### Quinones

#### Bianthrone from bianthrnyls

920.

2,2'-Dimethylbianthrnyl enolized by refluxing with anhydrous alc. KOH for 10 min., filtered, poured into a mixture of ice and concd. HCl, filtered, the residue dissolved in acetone, p-benzoquinone in acetone added, and kept 12 hrs. in the dark → 2,2'-dimethylbianthrone. Y: 90%. F. e. s. E. D. Bergmann and E. Loewenthal, *Bl.* 1952, 66; *Soc.* 1953, 2572.

### Chloranil

#### Dehydrogenation

921. Of several quinones tested as dehydrogenation agents, chloranil seems to be the most suitable. N. Dost, *R.* 71, 857 (1952); s. a. J. Swidinsky, F. H. McMillan, and J. A. King, *Am. Soc.* 76, 1148 (1954).

Palladium-carbon-magnesium oxide

Pd-C-MgO

24.

1,2,3,4,5,6-Hexahydroazulene passed at 320-330° through a catalyst of 5%-Pd-charcoal suspended on 40% MgO and 60% Norite, in a special apparatus (s. original)  $\rightarrow$  azulene. Y: 32%. A. G. Anderson, Jr., J. A. Nelson, and J. J. Tazuma, Am. Soc. 75, 4980 (1953).

Palladium, platinum-carbon

Pd, Pt-C

925.

in the vapor phase. 2,7-Dimethyltetrahydronaphthalene allowed to react at 440° with a charcoal catalyst containing 0.5% each of Pd and Pt → 2,7-dimethylnaphthalene. Y: 86%. W. Baker, J. F. W. McOmie, and W. K. Warburton, Soc. 1952, 2991.

926.

A 2% soln. of decahydroazulene in decalin passed at ca. 380° through a Pyrex tube filled with a Pd-Pt-charcoal catalyst → azulene. Y: 24%.—The yield could be improved by the use of a large amount of *decalin* as carrier. W. Baker, W. K. Warburton, and L. J. Breddy, Soc. 1953, 4149.

Via intermediates

v.i.

 $\beta,\gamma$ -Ethylenebromides from hydrocarbons

Dehydration via bromides

927.

A soln. of

A mixture of

3α-acetoxy-11-keto-12-bromo-24,24-diphenyl- $\Delta^{23}$ -cholene

in allyl bromide stirred and gently refluxed while treated with 2.2 molar equivalents of N-bromosuccinimide, and the product isolated after 12 min. → 3α-acetoxy-11-keto-12,21-dibromo-24,24-diphenyl- $\Delta^{20,22;23}$ -choladiene (startg. m. f. 699). Y: at least 70%.

and ca. 1 molar equivalent of N-bromosuccinimide in  $\text{CCl}_4$  boiled 8 min. over a 500 Watt lamp, evaporated in vacuo, then boiled 10 min. in allyl bromide → 3α-acetoxy-11-keto-12-bromo-24,24-diphenyl- $\Delta^{20,22;23}$ -choladiene (400 mg. from 620 mg.).

J. Heer and A. Wettstein, Helv. 36, 891 (1953).

## Dehydrogenation

Bromine in  $\text{CS}_2$  added dropwise at  $0^\circ$  during 1 min. to a soln. of 3,6-dihydrodibenzopentalene in  $\text{CS}_2$ , a rapid stream of  $\text{N}_2$  bubbled through the liquid until no more  $\text{HBr}$  is evolved, the solvent distilled off in vacuo, the residue dissolved in dry benzene,  $\text{Ag-acetate}$  added, and the suspension refluxed 2 hrs. → 1,2:4,5-dibenzopentalene. Y: 59%. C. T. Blood and R. P. Linstead, Soc. 1952, 2263.

## Oxygen ↓

Without additional reagents

w.a.r.

## Enolethers from acetals

3.7 g. 5,8-dimethoxy-2-keto-1,2,3,4-tetrahydrophthalene dimethyl ketal refluxed 2 hrs. in abs. xylene → 3.4 g. 1,4,6-trimethoxy-7,8-dihydronaphthalene. C. A. Grob and W. Jundt, Helv. 35, 2111 (1952).

## Hydroxyindoles

A mixture of isopropylidene-3,4-dihydroxyaniline and dimethyl bromomalonate refluxed 4 hrs. in benzene → dimethyl (isopropylidene-3,4-dihydroxyanilido)malonate (Y: 72%) added at  $240-245^\circ$  during 10 min. to paraffin oil → methyl isopropylidene-5,6-dihydroxyindoxyl-2-carboxylate (Y: 74%). **Benzofurans****Aryl ethers**

953.

Ethyl α-chloroacetoacetate added with stirring to a suspension of Na-phenolate in dry benzene at such a rate as to maintain gentle refluxing, which is continued with stirring for 4 hrs. → crude ethyl α-phenoxyacetoacetate (Y: 85-90%) added with stirring during 1 hr. below 5° to concd. H<sub>2</sub>SO<sub>4</sub>, and allowed to stand in the ice bath for 1 hr. longer → ethyl 3-methylcoumarilate (startg. m. f. 159) (Y: 35-42%). W. R. Boehme, *Org. Synth.* **33**, 43 (1953).

**Synthesis of O-heterocyclics with diketene****4-Methylcoumarins from phenols and diketene****via arylacetoacetic acid esters****O-Acetoacetylation**

954.

Diketene added during 1 hr. to an agitated suspension of resorcinol in boiling benzene containing a little triethylamine, and heating continued for 0.5 hr.  $\rightarrow$  m-hydroxyphenyl acetoacetate (Y: 99%) added during 15 min. with agitation and cooling at 70° to 98%  $\text{H}_2\text{SO}_4$ , and kept a further 0.5 hr. at the same temp.  $\rightarrow$  7-hydroxy-4-methylcoumarin (Y: 85%).—The yields, in general, run parallel to those obtained from the Pechmann reaction (cf. Synth. Meth. 1, 591; 2, 673, 682). F. e. s. R. N. Lacey, Soc. 1954, 854; O-acetoacetylation and f. O-heterocyclics s. a. other papers of this series.

### Pyridine ring from enamines

5.

97%  $\text{H}_2\text{SO}_4$  added to diethyl [(1-methyl-3-oxo-1-butenylamino)methylene]oxalacetate, cooled with ice to keep the temp. at ca. 50–55°, and allowed to stand 2 hrs. at room temp. after the exothermic reaction has subsided  $\rightarrow$  5-acetyl-3-carbethoxy-6-methyl-4-pyridinecarboxylic acid. Y: 70%. F. e. s. R. G. Jones, Am. Soc. 73, 5244 (1951).

### N-Heterocyclics from hydroxycarboxylic acid amides

6.

Concd.  $\text{H}_2\text{SO}_4$  added to a soln. of N-( $\alpha$ -methylbenzyl)benzylamide in glacial acetic acid, and the product isolated after disappearance of a red-brown color  $\rightarrow$  1-methyl-4,4-diphenyl-3-oxo-1,2,3,4-tetrahydroisoquinoline. Y: 91.55%.—Amides of aliphatic  $\alpha$ -hydroxyacids do not undergo this reaction, neither do the amides of  $\alpha$ -hydroxyacids in which the carbinol C-atom carries but 1 aryl group. None of these amides give a color with  $\text{H}_2\text{SO}_4$ . F. e. s. P. A. Petyunin, Ж. 22, 700 (1952); oxindoles with  $\text{ZnCl}_2$  s. Ж. 22, 697; C. A. 47, 5385e,a; limitations s. a. Ж. 22, 1187; C. A. 47, 7490b.

Selenium dioxide

SeO<sub>2</sub>

## Dehydration of alcohols

CHC(OH) → C:C

957.

A soln. of 900 mg. 1,2-di-(6-phenanthridinyl)ethanol in dioxane containing a little water refluxed 4 hrs. with SeO<sub>2</sub> → 600 mg. 1,2-di-(6-phenanthridinyl)ethylene. A. G. Caldwell, Soc. 1952, 2035.

Hydrochloric acid

HCl

s. 6, 862; s. a. 9, 601; P. L. Pauson, Am. Soc. 76, 2187 (1954)

## Dehydration-rearrangement

958.

An alc. soln. of 1.7 g. 2,2-dimethyl-1,1-diphenylpropan-1-ol refluxed 3 hrs. during the passage of dry HCl-gas → 1.35 g. 2-methyl-3,3-diphenyl-1-butene. F. e., also with p-toluenesulfonic acid as reagent, s. E. J. Skerrett and D. Woodcock, Soc. 1952, 2804.

Ethylenecarboxylic acids  
from hydroxycarboxylic acid esters

Het  $\downarrow$  O

*Without additional reagents*

*w.a.r.*

#### Trialkyl- via dialkyl-oxonium salts

$\leftarrow$

$\text{SbCl}_5$  added dropwise at  $-70^\circ$  to dry dimethyl ether which is vigorously agitated by a dry  $\text{N}_2$ -stream, and allowed to stand 0.5 hr.  $\rightarrow$  antimony pentachloride dimethyl etherate (Y: almost 100%) dissolved at  $-70^\circ$  in liq.  $\text{SO}_2$  with stirring by a slow  $\text{N}_2$ -stream, then satd. with HCl  $\rightarrow$  dimethyloxonium hexachloroantimonate (Y: almost 100%) dissolved in a minimum amount of ethylene chloride, treated with a concd. soln. of diazomethane in ethylene chloride, and the product isolated after 1.5 hrs.  $\rightarrow$  trimethyloxonium hexachloroantimonate (Y: 65%). F. e. s. F. Klages and H. Meuresch, B. 85, 863 (1952).

#### Addition to Nitrogen

Het  $\downarrow$  N

*Without additional reagents*

*w.a.r.*

#### Hydrochlorides

s. 2, 829; s. a. R. B. Moffett, Org. Synth. 34, 64 (1954)

#### Resolution of stereoisomers via salts

$\leftarrow$

s. 5, 666; s. a. B. E. Leach and J. H. Hunter, Biochem. Prep. 3, 111 (1953); B. R. Baker et al., J. Org. Chem. 18, 178 (1953); W. Theilacker and H.-G. Winkler, B. 87, 690 (1954); amines with L-glutamic acid s. C. A. Grob and E. F. Jenny, Helv. 35, 2106 (1952)

**Quaternary ammonium salts  
from tert. amines**

991.

The formation of quaternary salts is faster in *polar solvents*.—E: A mixture of 1,4-dimethylpiperazine, ethylene bromide, and ethylene glycol heated slowly to 100°, and kept 1.5 hrs. at this temp.  $\rightarrow$  triethylenediamine di(methobromide). Y: 70%. O. Hromatka and O. Kraupp, M. 82, 880 (1951); s. a. W. R. Brasen and C. R. Hauser, Org. Synth. 34, 58, 61 (1954).

Acetic acid

 $\text{CH}_3\text{COOH}$ 
**Pure quaternary ammonium salts  
from tert. amines  
Methosulfates**

992.

A soln. of gramine added dropwise at 10–15° during 0.5 hr. to a soln. of dimethyl sulfate, both in abs. tetrahydrofuran containing glacial acetic acid, and allowed to stand 3 hrs. at room temp.  $\rightarrow$  trimethylskatylammonium methosulfate. Y: 80%. C. Schöpf and J. Thesing, Ang. Ch. 63, 377 (1951).

Triphenyl phosphite methiodide

 $(\text{C}_6\text{H}_5\text{O})_3\text{PCH}_3\text{I}$ 
**Quaternary ammonium salts  
from alcohols**

993.

A mixture of triphenyl phosphite methiodide, abs. ethanol, and dimethylaniline heated 15 min. on a steam bath  $\rightarrow$  ethyldimethylphenylammonium iodide. Y: 88%. S. R. Landauer and H. N. Rydon, Soc. 1953, 2224.

**Addition to Sulfur****Het  $\Downarrow$  S***Without additional reagents**w.a.r.***Sulfonium salts**

s. 2, 836; 6, 910; s. a. C. T. Bahner, P. P. Neblett, Jr., and H. A. Rutter, Jr., *Am. Soc.* **74**, 3453 (1952); also without solvent s. H. Böhme and P. Heller, *B.* **86**, 785 (1953)

## *Index*

### Volume 9

(Cumulative Index, Volumes 1–5, see Volume 5, page 503;  
Volumes 6–8, see Volume 8, page 387)

The subject index lists the names of the methods, types of compounds, reagents, etc. For specific compounds and for authors (when a method is not named after them) the reader may be referred to the indexes of abstract journals. Complex compounds, as those with several functional groups, are referred to under the related simpler compounds, under *special s.* E.g. aminocarboxylic acids are found under carboxylic acids. Only compounds beginning with letters other than those of the parent or main compounds are listed under this subentry, and entry numbers are omitted because they are specified when the compound is given as a main entry. Derivatives used for characterization, identification, or separation are listed under the subentry *derivatives*. Methods of synthesis for a given substance are indexed under the name of this substance and the subentry *from*, e.g. carboxylic acids from alcohols, hydrocarbons. Syntheses carried out from a particular starting material are indexed under the starting material and the subentry *startg. m. f.* (starting material for the preparation of . . .), e.g. alcohols, startg. m. f. carboxylic acids, ketones.

Classes of compounds may be designated merely by the functional group that is changed during the reaction. Ring compounds may also refer to the corresponding hydrogenated rings, unless the latter are listed specifically. If that be the case, then, as in several other cases, the *inversion* has been made use of that is customary in the indexes of Chemical Abstracts. Dihydrofurans, e.g., may be found under Furans, dihydro-. All single letters, which are separated from the name by a hyphen, are being ignored in regard to alphabetic arrangement, e.g., 'O-Acetyl derivatives' are listed under A.

## *Register*

### Band 9

(Generalregister Band 1–5 siehe Band 5, Seite 503;  
Band 6–8 siehe Band 8, Seite 387)

Im alphabetischen Register finden sich als Schlagworte Methoden, Verbindungsklassen, Reagenzien u. dgl.; Einzelverbindungen und Autoren, soweit nicht eine Methode nach ihnen benannt ist, sind, wie

bisher, in den Registern der Referatenblätter zu suchen. Auf kompliziertere Verbindungen, z. B. mit mehreren funktionellen Gruppen, ist bei den entsprechenden einfacheren Verbindungen unter *special s.* (spezielle siehe) hingewiesen, z. B. bei Carbonsäuren auf Aminocarbonsäuren. Es wird hier jedoch nur auf Verbindungen hingewiesen, die einen anderen Wortanfang haben und deshalb an anderer Stelle im Register stehen. Derivate, die zur Charakterisierung, Identifizierung, oder Trennung dienen, sind unter *derivatives* aufgeführt. Methoden zur Synthese eines bestimmten Endprodukts findet man beim Schlagwort dieses Endprodukts unter *from* (aus) registriert, z. B. Carbonsäuren aus Alkoholen, Kohlenwasserstoffen. Synthesen, die sich mit einem bestimmten Ausgangsmaterial ausführen lassen, sind bei dem Schlagwort des Ausgangsmaterials unter *startg. m. f.* (Ausgangsmaterial für die Darstellung von ...) zu suchen, z. B. Alkohole, Ausg. f. Ketone, Carbonsäuren.

Die Bezeichnung der Verbindungsklassen kann sich auf funktionelle Gruppen beschränken, die bei der Reaktion verändert werden. Ringbezeichnungen können sich auch auf die entsprechenden hydrierten Ringe beziehen. Sind hydrierte Ringe aber besonders aufgeführt, dann ist bei ihnen, wie auch in einigen anderen Fällen, von der Inversion Gebrauch gemacht worden, wie sie in den Sachregistern der «Chemical Abstracts» üblich ist. Z. B. stehen Dihydrofurane unter Furane, Dihydro-. Griechische Buchstaben und Einzelbuchstaben, die vom eigentlichen Namen durch Bindestrich getrennt sind, werden bei der alphabetischen Anordnung nicht berücksichtigt, z. B. stehen «O-Acetyl-derivate» unter A.

*Sulfurous acid esters*

— startg. m. f.  
acetals 9, 335

*Sulfur trichlorides*

— from  
disulfides 9, 587

*Sulfuryl chloride 9, 584, 607**Synthesis (s. a. Condensation)*

— by selective replacement of  
halogen 6, 806

— with addition of 1 C-atom  
acetals from orthoformic acid  
esters 9, 837

aldehydes from halides 9, 903

carboxylic acid esters from  
hydrocarbons 9, 803

— acids from ammonium salts.  
quaternary 9, 866

— with addition of 2 C-atoms  
 $\alpha$ -aminocarboxylic acids from  
oxo compounds 9, 336

—, asym. 9, 741

*Tautomerism s. Valence tautomerism**Tellurium compounds, organo 9, 648**1,1,2,2-Tetraarylethanes 9, 874**1,2,4,6-Tetraazaindenes 9, 424**Tetracycline derivatives 9, 125**Tetraethylammonium bromide as additional reagent 9, 606**Tetramethylammonium acetate as additional reagent 9, 552**Tetrazoles*

— from  
3,6,9-tricarbaundecaz-1,3,8,10-  
tetraenes 9, 388

*Tetrazolium radicals 9, 989**Thallous alkoxide 9, 357/8**Thermolysis s. Pyrolysis**Thia- s. a. Thio-**Thiacylamines s. Carboxylic acid thioamides**1,3,4-Thiadiazines*

— via  $\alpha$ -(dithiocarbazyl)oxo  
compounds 9, 697

*1,3,5-Thiadiazines, tetrahydro-*

9, 664

*Thianaphthenequinones*

— startg. m. f.  
o-mercaptophenylacetic acids  
9, 121

thioöxindoles 9, 121

*Thianaphthenes s. a. Thioöxindoles**Thiazole ring, 2-amino-*

— from  
amines 9, 659  
o-aminothiocyantes 9, 659

*Thiazoles*

—, 2-amino-

— from  
2-ketothiocyantes 9, 408

—, 2,4-diamino-

— from  
 $\alpha$ -cyanosulfonates 9, 663

*Thiazolidines 9, 666**2-Thiazolidones*

— from  
dithiolcarbonic acid esters 9, 577

*4-Thiazolidones*

— from  
oxo compounds 9, 672

aldehydes 9, 662

*5-Thiazolidone-2-thiones*

— startg. m. f.  
 $\alpha$ -aminocarboxylic acids 9, 336

*Thiazolidone ring opening 9, 223**Thiazolines*

— from  
hydroxydithiocarbamic acid  
esters 9, 705

— startg. m. f.  
aminodithiolcarbonic acid esters  
9, 705

*5-Thiazolones 9, 704**Thio- s. a. Alkylthio-, Sulfenyl-, Thia-**Thioacetals s. Mercaptals**Thioacetamide as additional reagent*

9, 683

*N-Thioacylamidines, cleavage*

9, 483

- Thioaldehyde trimers* s. s-Trithianes  
*Thioamides* s. Carboxylic acid thioamides  
*Thiocarbamic acid esters* s. Thionocarbamic acid esters

Saccharic acids

## Abbreviations - Abkürzungen

abs. . . .	absolute . . . . .	absolut
alc. . . .	alcoholic . . . . .	alkoholisch
aq. . . .	aqueous . . . . .	wäßrig
ar. . . .	aromatic . . . . .	aromatisch
atm. . . .	atmosphere(s) . . . . .	Atmosphäre(n)
cf. . . .	compare . . . . .	vergleiche
concd. . . .	concentrated . . . . .	konzentriert
d. . . .	density . . . . .	Dichte
dil. . . .	diluted . . . . .	verdünnt
et al. . . .	and others . . . . .	und andere
E. . . .	example . . . . .	Beispiel
e.g. . . .	for example . . . . .	zum Beispiel
F. e. s. . . .	Further example(s) see . . . .	weitere(s) Beispiel(e) siehe
hr(s). . . .	hour(s) . . . . .	Stunde(n)
liq. . . .	liquid . . . . .	flüssig
min. . . .	minutes . . . . .	Minuten
N. . . .	normal . . . . .	normal
prepn. . . .	preparation . . . . .	Darstellung
prim. . . .	primary . . . . .	primär
s. . . .	see . . . . .	siehe
s. a. . . .	see also . . . . .	siehe auch
satd. . . .	saturated . . . . .	gesättigt
sec. . . .	secondary . . . . .	sekundär
soln. . . .	solution . . . . .	Lösung
startg. m. f.	starting material for . . . .	Ausgangsmaterial
	(the preparation of...)	für die Darstellung von ...
subst. . . .	substituted . . . . .	substituiert
sym. . . .	symmetrical . . . . .	symmetrisch
temp. . . .	temperature(s) . . . . .	Temperatur(en)
tert. . . .	tertiary . . . . .	tertiär
v.i. . . .	via intermediates . . . . .	über Zwischenprodukte
w. a. r. . . .	without additional reagents	ohne Hilfsstoffe
Y *) . . .	yield . . . . .	Ausbeute

\*) When yields are listed in parentheses, the yields so designated refer to the immediately preceding step of a multi-step reaction.

Bei mehrstufigen Synthesen beziehen sich eingeklammerte Ausbeuteangaben auf die unmittelbar vorhergehende Stufe.

*Symbols - Zeichen*

(on the right half of the page)

(auf der rechten Hälfte der Seite)

Electrolysis	↘	Elektrolyse
Ring closure	○	Ringschluß
Ring opening	⊂	Ringöffnung
'see title on the left half of the page'	←	«siehe Titel auf der linken Hälfte der Seite»

*Journal Abbreviations - Zeitschriften-Abkürzungen*

A.	Liebig's Annalen der Chemie
A. ch.	Annales de Chimie
Am. Soc.	Journal of the American Chemical Society
Ar.	Archiv der Pharmazie und Berichte der Deutschen Pharmazeutischen Gesellschaft
Ark. Kemi	Arkiv för Kemi, Mineralogi och Geologi
B.	Chemische Berichte
Biochem. Prep.	Biochemical Preparations
Bl.	Bulletin de la Société Chimique de France
C. A.	Chemical Abstracts
C. r.	Comptes rendus (Paris)
G.	Gazzetta Chimica Italiana
H.	Hoppe Seyler's Zeitschrift für physiologische Chemie
Helv.	Helvetica Chimica Acta
J. Org. Chem.	Journal of Organic Chemistry
J. pr.	Journal für praktische Chemie
M.	Monatshefte für Chemie
Org. Synth.	Organic Syntheses
R.	Recueil des Travaux Chimiques des Pays-Bas
Ж	Journal of General Chemistry (Russia)
Soc.	Journal of the Chemical Society
Synth. Meth.	Synthetic Methods of Organic Chemistry

For other journal abbreviations see Beilstein, Handbuch der organischen Chemie or Chemical Abstracts.

Die übrigen Zeitschriften-Abkürzungen siehe Beilsteins Handbuch der organischen Chemie oder Chemical Abstracts

# Reagents - Hilfsstoffe

Volume 1-9

Band 1-9

w.a.r.(heat,irradiation, <sup>42</sup> , electric discharge)	K-xanthate	CuCN
Li, Na, Na/K, K	Na <sub>2</sub> S, Na <sub>2</sub> S <sub>2</sub> , Na <sub>2</sub> S <sub>x</sub> ,	CuSCN
LiH, NaH	NaHS	Cu(I,II) sulfite
Na,Hg	Na <sub>2</sub> Se <sub>x</sub>	CuCl, CuBr/Mg, CuI/Mg,
Bases	KHS	CuCl <sub>2</sub>
Alkalies	Na <sub>2</sub> S <sub>2</sub> O <sub>3</sub>	Cu <sup>+</sup> , Cu <sup>++</sup>
Alkali hydroxide	Na <sub>2</sub> SO <sub>3</sub> , K <sub>2</sub> SO <sub>3</sub> , NaHSO <sub>3</sub>	C <sub>6</sub> H <sub>5</sub> COOAg
Aq. alkali hydroxide	NaF, KF, KHF <sub>2</sub>	AgCN
NaOH, KOH	LiCl	AgN <sub>3</sub>
Alkali in water a. alcohol	Alkali iodides, NaI, KI	AgNO <sub>2</sub>
NaOH/alcohols	Alkali salts	AgNO <sub>3</sub>
KOH/alcohols	Alkaloid-alkali salts	AgF-Cu
Na/alcohol, NaOR,	Na <sup>+</sup> , K <sup>+</sup>	Ag <sup>+</sup>
(Sodium compound)	NH <sub>3</sub>	CaH <sub>2</sub>
NaOCH <sub>3</sub> , NaOC <sub>2</sub> H <sub>5</sub> ,	Organic bases	CaO, BaO, BaO-SiO <sub>2</sub>
NaOC <sub>4</sub> H <sub>9</sub> -n	Resin base	Ca(OH) <sub>2</sub> , Ba(OH) <sub>2</sub>
K/alcohol, KOR	Triton B, Choline, BTAB	Ba(OR) <sub>2</sub>
K-isopropoxide,	Amines, prim.,	CaC <sub>2</sub> , Ca/NH <sub>3</sub>
K-tert-butoxide	Alkylamines	(CH <sub>3</sub> COO) <sub>2</sub> Ba
n-C <sub>4</sub> H <sub>9</sub> Li, C <sub>6</sub> H <sub>5</sub> Li	Methyl-, n-Butyl-, Benzyl-	CaCO <sub>3</sub> , BaCO <sub>3</sub>
(C <sub>6</sub> H <sub>5</sub> ) <sub>3</sub> C·Na	amine	CaSO <sub>4</sub>
Alkali amide	Diethylamine, Morpho-	CaCl <sub>2</sub> , BaCl <sub>2</sub> -C
Li/liq. NH <sub>3</sub> ,	line	Mg, Mg,Hg, Mg/MgI <sub>2</sub>
Li/liq. NH <sub>3</sub> /alcohol,	Tert. amines, Trialkyl-	Zn, Zn,Cu, Zn,Hg
LiNH <sub>2</sub> , (C <sub>2</sub> H <sub>5</sub> ) <sub>2</sub> NLi,	amines, Trimethyl-	Cd, Hg
Li-methylanilide	amine, Triethylamine	HgO, MgO
Na/liq. NH <sub>3</sub> , NaNH <sub>2</sub> ,	Piperidine, N-Ethyl-	Mg(OH) <sub>2</sub>
Na-anilide	piperidine, N-Methyl-	Mg(OR) <sub>2</sub>
K/liq.NH <sub>3</sub> , KNH <sub>2</sub>	morpholine	RMgHal, CH <sub>3</sub> MgI,
Alkali in pyridine	Aniline	C <sub>6</sub> H <sub>5</sub> MgBr
Na <sub>2</sub> O <sub>2</sub>	Dialkyl-, Dimethyl-,	R <sub>2</sub> NMgBr, C <sub>6</sub> H <sub>5</sub> N(CH <sub>3</sub> )-
Na <sub>2</sub> CO <sub>3</sub> , NaHCO <sub>3</sub> ,	Diethylaniline	MgBr
K <sub>2</sub> CO <sub>3</sub> , KHCO <sub>3</sub>	Pyridine, Lutidine,	Zinc alkyls, Zinc alkyl
HCOONa	Collidine, Quinoline	halides
CH <sub>3</sub> COONa, CH <sub>3</sub> COOK	Cu, Ag, Ag-Cu, Cu,Mg	Organomercury
Na-citrate	Copper oxide, Cu <sub>2</sub> O, CuO	compounds
Alkali cyanide, NaCN,	Cu(OH) <sub>2</sub>	CdCO <sub>3</sub>
KCN	AgOH	Mercury resin
KOCN	Cu·C≡C·C <sub>6</sub> H <sub>5</sub>	(CH <sub>3</sub> COO) <sub>2</sub> Hg
NaSCN, KSCN	Ag <sub>2</sub> CO <sub>3</sub>	Zn(CN) <sub>2</sub> , Hg(CN) <sub>2</sub>
NaN <sub>3</sub>	CH <sub>3</sub> COOAg, CF <sub>3</sub> COOAg	Hg(ONC) <sub>2</sub> (fulminate)
NaNO <sub>2</sub> , KNO <sub>2</sub>	Cupric carbonate, basic	Mg(NO <sub>3</sub> ) <sub>2</sub>
NaNO <sub>3</sub> , KNO <sub>3</sub>	(CH <sub>3</sub> COO) <sub>2</sub> Cu	BeSO <sub>4</sub> , MgSO <sub>4</sub> , HgSO <sub>4</sub>
KH <sub>2</sub> PO <sub>4</sub>	Fehling solution	MgCl <sub>2</sub> , MgBr <sub>2</sub>
	Copper borate	ZnCl <sub>2</sub> , ZnCl <sub>2</sub> ·2NH <sub>3</sub>

# HELVETICA CHIMICA ACTA

EDENDA CURAT SOCIETAS CHIMICA HELVETICA

Since 1918 the Swiss Chemical Society has been editing its own periodical for Pure Chemistry which is published under the title «HELVETICA CHIMICA ACTA». It is the primary aim of this periodical to publish the results of researches carried out by all chemists living in Switzerland and by Swiss chemists residing abroad. The publications are in German, French, or Italian.

«HELVETICA CHIMICA ACTA» are published yearly in 8 numbers with a total of approximately 2,300 pages, the year beginning on the 1<sup>st</sup> February. The subscription for the current volume is Swiss frs. 80.—, plus postage (abroad frs. 7.50). Back volumes can be supplied as follows; reprint volumes, I–XIV, set \$ 350.—; single volumes, paper bound, \$ 25.— each, plus postage; from Vol. XXVI, Swiss frs. 80.— each, plus postage. The price for single numbers is Swiss frs. 12.—, plus postage.

## Kartothek der Thiazolverbindungen

Zusammengestellt von

**Bernhard Prijs**

Wissenschaftlicher Assistent an der Universität Basel

1352 Blatt in 4 Ringbüchern, 1951. sFr. 166.40

### Aus dem Vorwort

Die letzte vollständige Zusammenfassung der Thiazolverbindungen stammt aus dem Jahre 1919 (Beilstein, 4. Aufl.). Die seit diesem Zeitpunkt stark angewachsene Literatur auf diesem intensiv bearbeiteten Gebiet machte es erwünscht, die Literatur über diese Verbindungsklasse erneut zusammenzustellen.

Um zu vermeiden, daß eine solche Sammlung rasch veraltet oder in eine Reihe von Ergänzungsbänden zersplittert wird, haben wir uns für die Form einer Kartothek entschieden, die es erlaubt, neue Verbindungen oder neue Angaben über bereits registrierte Verbindungen mit Hilfe periodisch erscheinender Ersatz- und Nachtragsblätter am richtigen Platz einzuordnen und so das Werk stets dem jeweiligen Stand des Wissens anzupassen.

Auf den einzelnen Kartothekblättern findet man die Angaben über Synthese, Eigenschaften und Reaktionen der einzelnen Verbindungen; darüber hinaus erlaubt es das ausführliche Sachregister, sich über bestimmte Verbindungstypen oder Reaktionen innerhalb der Thiazolreihe leicht zu orientieren.

# Quantitative Methods in Histology and Microscopic Histochemistry

By

OLAVI ERÄNKÖ, Helsinki

In statistical collaboration with JAAKKO KIHLEBERG, Helsinki

160 pages, 49 figures. 1955. sFr. 19.75

## PREFACE

This book is addressed to those who would like to use quantitative methods in the study of microscopical specimens but do not know how to do it. The constantly increasing number of microscopical investigations dealing with quantitative aspects mirrors the growing interest in the quantitative methods, and many of such studies have disclosed unforeseen, interesting realms in the properties of tissues and cells. However, no systematic introduction to the quantitative methods in histology and microscopic histochemistry is available, although much valuable information in this respect is scattered in recent literature. This little book is a humble effort to fill the need of such a guide. It is hoped that it will prove useful in the hands of histologists and histochemists who are not familiar with the possibilities for quantitative work in their field and also to the students of various branches of experimental biology who would welcome the addition of quantitative microscopical methods to their armament.

## CONTENTS

Variability and its Measures — Animal Experiments — Preparations of Microscopical Specimens — Specimen Thickness — Microscopic Demonstration of Tissue Details — Estimation of Relative Volumes — Counting, Sizing and Various Quantitative Criteria — Absorption Measurements — Equipment for Absorption Measurements — Measurement of the Intensity of Light—Statistical Analysis of Results—References—Subject Index.
